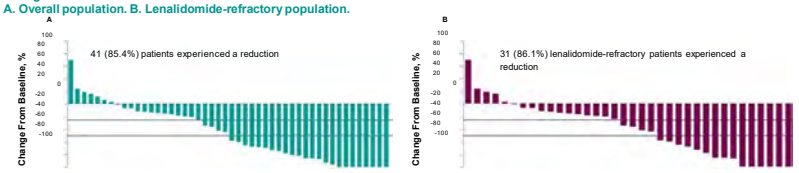
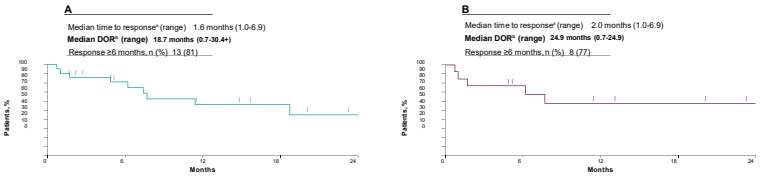
Change From Baseline in Disease Burden
A. Overall population. B. Lenalidomide-refractory population.



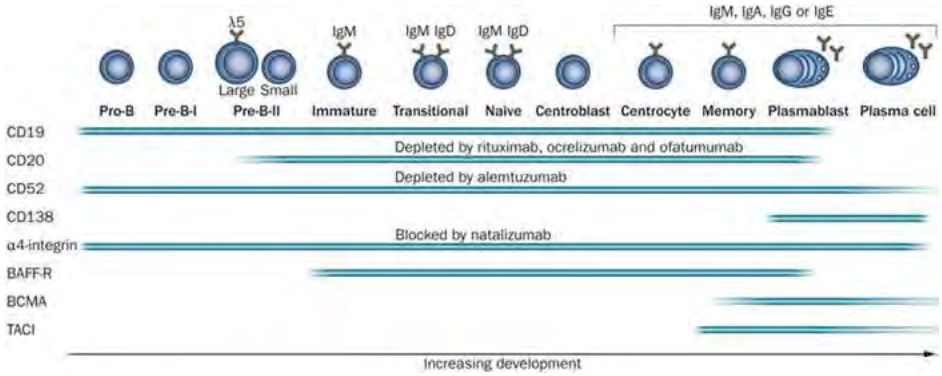
[a]12 patients were not included because they did not have ≥2 postbaseline efficacy assessments and/or had major protocol violations.

Duration of Response. A. All responders (n = 22). B. Lenalidomide-refractory responders (n = 13).

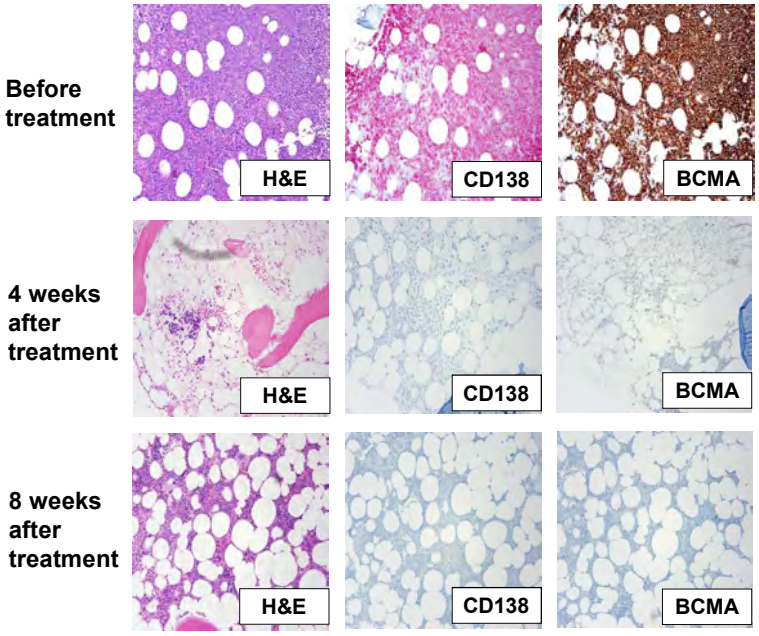


DOR, duration of response.
[a]No progressive disease at last assessment
[b]Best objective response as stringent complete response, complete response, very good partial response, or partial response
[c]From Kaplan-Meier method

Expression of Surface Markers in B cell Development



CAR-BCMA Effectively Eradicates Disease



Conclusions

- Immune suppression in tumor microenvironment in myeloma increases from MGUS to active MM
- Mechanisms of immune escape include
  - Downregulation of HLA expression
  - Dysfunction of antigen presentation
  - Increase in MDSCs
  - Development of Th17 cells
  - Increase in PD-L1 expression
  - Upregulation of PD-1 expression on T cells
- Immune therapy can show clinical benefits several of these pathways including:
  - PD-1 blockade
  - CAR-T cells targeting BCMA
  - Vaccines
  - Immunosuppressive pathways: Th17, MDSCs

MyPRS® Example MyPRS Report

The MyPRS™ (Myeloma Prognostic Risk Signature) assay is a microarray-based gene expression profile (GEP) which can be used to assist the management of patients with multiple myeloma (MM) and related disorders.

Since 2006, the 70-gene prognostic signature, developed by the University of Arkansas for Medical Sciences (UAMS) has been applied to over 4,700 patients in studies performed in 4 countries and described in 17 peer-reviewed publications[5].

MyPRS results from the analysis of an example patients' bone marrow aspirate specimen are shown below. Please contact customerservice@signalgenetics.com for information on ordering MyPRS.

Select Case Number: CL12-001876.CEL

ResultsPX Account ID	Patient MRN	Facility	Date of analysis:
client@examplehospital.com	5841265	Example Hospital	3/11/2016

Specimen Collection Date: 3/6/2016 Specimen Type: Bone Marrow Aspirate
Patient Name: Smith, J Client Name: University Healthcare Network
CD-138+ Cell Pre-Sort: 1.38%, Pre-sort Total Count: 138.3 million cells

MyPRS GEP70 Risk Score Result:

LOW RISK (MyPRS Plus score<45.2)	77% Probability of being recurrence-free at 5-years*. High probability of favorable prognosis.

*TT3 independent validation series outcome data obtained from UAMS Myeloma Institute for Research and Therapy and analyzed by Signal Genetics™ on 24/6/13. These data include patients from Shaughnessy et al (2007) with updated follow-up records.

Identification and characterization of genetic alterations are essential for diagnosis of multiple myeloma and may guide therapeutic decisions. Currently, genomic analysis of myeloma to cover the diverse range of alterations with prognostic impact requires fluorescence *in situ* hybridization (FISH), single nucleotide polymorphism arrays, and sequencing techniques, which are costly and labor intensive and require large numbers of plasma cells. To overcome these limitations, we designed a targeted-capture next-generation sequencing approach for one-step identification of *IGH* translocations, V(D)J clonal rearrangements, the IgH isotype, and somatic mutations to rapidly identify risk groups and specific targetable molecular lesions. Forty-eight newly diagnosed myeloma patients were tested with the panel, which included *IGH* and six genes that are recurrently mutated in myeloma: *NRAS*, *KRAS*, *HRAS*, *TP53*, *MYC*, and *BRAF*. We identified 14 of 17 *IGH* translocations previously detected by FISH and three confirmed translocations not detected by FISH, with the additional advantage of breakpoint identification, which can be used as a target for evaluating minimal residual disease. IgH subclass and V(D)J rearrangements were identified in 77% and 65% of patients, respectively. Mutation analysis revealed the presence of missense protein-coding alterations in at least one of the evaluating genes in 16 of 48 patients (33%). This method may represent a time- and cost-effective diagnostic method for the molecular characterization of multiple myeloma. (*J Mol Diagn 2017, 19: 99–106; http://dx.doi.org/10.1016/j.jmoldx.2016.08.004*)

Conclusions

- Genetics can help classify MM subgroups
- Genetics have powerful prognostic implications
- Combined with standard clinical factors can best stratify patients
- Clinical tests are available
- Quality of process is critical

What are the optimal imaging techniques in Myeloma?

María-Victoria Mateos
University Hospital of Salamanca
University of Salamanca
Spain

What is the role of imaging in Myeloma?

- Precise identification of bone disease, as sign of **organ damage and need to start treatment**
- Identification of sites of **extra-medullary disease** (total body techniques)
- Differential diagnosis between localized disease **(BSP)** and systemic disease **(MM)**
- Correct identification of sites of bone disease at risk of complications (fractures, neurological complications) (MRI gold standard)
- **Correct follow up of the patients after treatment**

Zamagni E. et al, BJH 2012

ACTIVE MYELOMA: the CRAB CRITERIA

Myeloma-related end organ damage due to the plasma cell proliferative process

- **C:** Calcium levels increased
- **R:** Renal insufficiency
- **A:** Anemia
- **B:** Bone lesions, osteolytic or osteoporosis

X-ray was the standard of care for bone lesions detection

Rajkumar V. et al., Lancet Oncology 2014

Panel: Revised International Myeloma Working Group diagnostic criteria for multiple myeloma and smouldering multiple myeloma

Definition of multiple myeloma

Clonal bone marrow plasma cells ≥10% or biopsy-proven bony or extramedullary plasmacytoma* and any one or more of the following myeloma defining events:

- Myeloma defining events:
  - Evidence of end organ damage that can be attributed to the underlying plasma cell proliferative disorder, specifically:
    - Hypercalcaemia: serum calcium >0·25 mmol/L (>1 mg/dL) higher than the upper limit of normal or >2·75 mmol/L (>11 mg/dL)
    - Renal insufficiency: creatinine clearance <40 mL per min† or serum creatinine >177 μmol/L (>2 mg/dL)
    - Anaemia: haemoglobin value of >20 g/L below the lower limit of normal, or a haemoglobin value <100 g/L
    - Bone lesions: one or more osteolytic lesions on skeletal radiography, CT, or PET-CT‡
  - Any one or more of the following biomarkers of malignancy:
    - Clonal bone marrow plasma cell percentage* ≥60%
    - Involved:uninvolved serum free light chain ratio§ ≥100
    - >1 focal lesions on MRI studies¶

Rajkumar et al. Lancet Oncology 2014; 15: e538-48

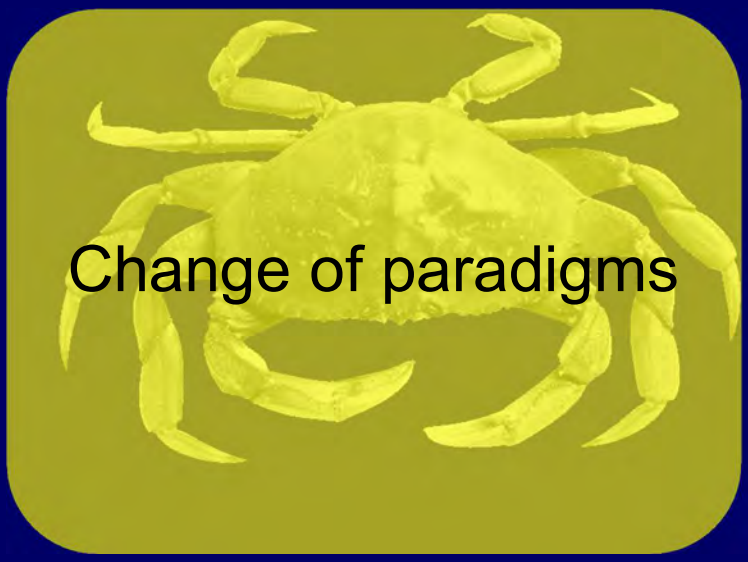
International Myeloma Working Group updated criteria for the diagnosis of multiple myeloma

S Vincent Rajkumar, Meletios A Dimopoulos, Antonio Palumbo, Joan Blade, Giampaolo Merlini, Maria-Victoria Mateos, Shaji Kumar, Jens Hillengass, Efstathios Kastritis, Paul Richardson, Ola Landgren, Bruno Paiva, Angela Dispenzieri, Brendan Weiss, Xavier LeLeu, Sonja Zweegman, Sagar Lonial, Laura Rosiñol, Elena Zamagni, Sundar Jagannath, Orhan Sezer, Sigurdur Y Kristinsson, Jo Caers, Saad Z Usmani, Juan José Lahuerta, Hans Erik Johnsen, Meral Beksac, Michele Cavo, Hartmut Goldschmidt, Evangelos Terpos, Robert A Kyle, Kenneth C Anderson, Brian G M Durie, Jesus F San Miguel

This International Myeloma Working Group consensus updates the disease definition of multiple myeloma to include validated biomarkers in addition to existing requirements of attributable CRAB features (hypercalcaemia, renal failure, anaemia, and bone lesions). These changes are based on the identification of biomarkers associated with near inevitable development of CRAB features in patients who would otherwise be regarded as having smouldering multiple myeloma. A delay in application of the label of multiple myeloma and postponement of therapy could be detrimental to these patients. In addition to this change, we clarify and update the underlying laboratory and radiographic variables that fulfil the criteria for the presence of myeloma-defining CRAB features, and the histological and monoclonal protein requirements for the disease diagnosis. Finally, we provide specific metrics that new biomarkers should meet for inclusion in the disease definition. The International Myeloma Working Group recommends the implementation of these criteria in routine practice and in future clinical trials, and recommends that future studies analyse any differences in outcome that might occur as a result of the new disease definition.

www.thelancet.com/oncology Vol 15 November 2014

Rajkumar V. et al., Lancet Oncology 2014

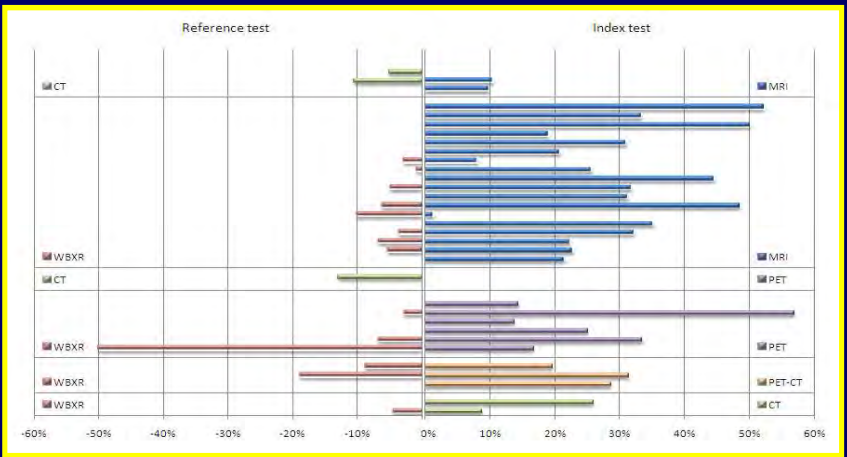


International Myeloma Working Group updated Criteria for the diagnosis of Multiple Myeloma

- **Definition of myeloma bone disease (CRAB):clear evidence of one or more sites of osteolytic bone destruction (at least 5 mm or more in size) seen on CT, WBLDCT, PET/CT, regardless of weather they can be visualized on skeletal radiography or not**
- If doubt lesions on CT or PET/CT: close follow-up every 3-6 months and/or biopsy of the lesion
- Oseoporosis per se in the absence of lytic lesions is not sufficient for CRAB

Rajkumar V. et al., Lancet Oncology 2014

Systematic review
New imaging techniques had a higher detection rate as compared to WBXR*



* Except for ribs and skull

Regelink JC et al. BJH 2013;162:50-61.

MRD supersedes CR
and could meet some of the key requirements for a surrogate endpoint such as:

- move the PFS of patients in remission from 3–5 years to 8–10 years
- independence from treatment
- predict different outcomes upon different MRD-negative rates
- useful in all patient subgroups
- reliable and widely available techniques, inside and outside the BM

San Miguel J. EHA 2016

ACTIVE MYELOMA: the CRAB CRITERIA

Myeloma-related end organ damage due to the plasma cell proliferative process

- **C:** Calcium levels increased
- **R:** Renal insufficiency
- **A:** Anemia
- **B:** Bone lesions, osteolytic or osteoporosis

Definition of multiple myeloma

Clonal bone marrow plasma cells ≥10% or biopsy-proven bony or extramedullary plasmacytoma* and any one or more of the following myeloma defining events:

- Myeloma defining events:
  - Evidence of end organ damage that can be attributed to the underlying plasma cell proliferative disorder, specifically:
    - Hypercalcaemia: serum calcium >0·25 mmol/L (>1 mg/dL) higher than the upper limit of normal or >2·75 mmol/L (>11 mg/dL)
    - Renal insufficiency: creatinine clearance <40 mL per min† or serum creatinine >177 μmol/L (>2 mg/dL)
    - Anaemia: haemoglobin value of >2·0 g/L below the lower limit of normal, or a haemoglobin value <10·0 g/L
    - Bone lesions: one or more osteolytic lesions on skeletal radiography, CT, or PET-CT‡
  - Any one or more of the following biomarkers of malignancy:
    - Clonal bone marrow plasma cell percentage* ≥60%
    - Involved:uninvolved serum free light chain ratio§ ≥100
    - >1 focal lesions on MRI studies‖

Rajkumar V. et al., Lancet Oncology 2014 IMWG, BJH 2003

Is conventional radiography "the gold standard" for depicting myeloma osteolytic lesions in 2016?

- Lytic lesions are visible only if at least 30%-50% of trabecular substance is lost
- Unable to identify small osteolytic lesions (planar technique)
- Low sensitivity in the spine
- Unable to distinguish between osteoporotic vertebral fractures and MM related ones
- It cannot be used for the assessment of response to treatment

Frequent underestimation of MM bone disease

Van Lammeren-Venema D et al., Cancer 2011

PET/CT vs WBXR OR MRI in Multiple Myeloma

- 18 studies, 798 patients
- 7 studies PET ± CT vs WBXR: 6/7 PET showed more lytic lesions with the exception of the skull
- 5 studies PET ± CT vs MRI spine and/or pelvis: 4/5 MRI was superior in detecting myeloma bone disease, especially in case of diffuse bone infiltration
- 1 study PET/CT vs WBMRI: concordant in 80% cases
- Identification of extra-medullary disease

- ***CT part of PET/CT is valid for assessing bone destruction***
- ***PET/CT is the functional assessment for disease metabolism***

Van Lammeren-Venema D et al., Cancer 2011

Role of ^{18}F-FDG PET/CT in the diagnosis and management of multiple myeloma and other plasma cell disorders: a consensus statement by the International Myeloma Working Group

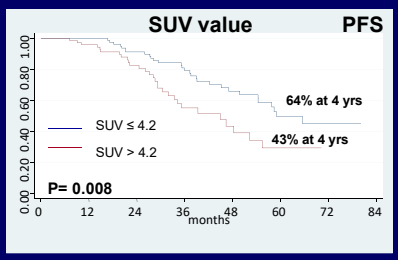
Michele Cavo, Evangelos Terpos, Cristina Nanni, Philippe Moreau, Suzanne Lentzsch, Sonja Zweegman, Jens Hillengass, Monika Engelhardt, Saad Z Usmani, David H Vesole, Jesus San-Miguel, Shaji K Kumar, Paul G Richardson, Joseph R M Bihael, Fernando Leal da Costa, Meletios Athanasios Dimopoulos, Chiara Zingaretti, Niels Abildgaard, Hartmut Goldschmidt, Robert Z Orlowski, Wee Joo Chng, Hermann Einsele, Sagar Lonial, Bart Barlogie, Kenneth C Anderson, S Vincent Rajkumar, Brian G M Durie, Elena Zamagni

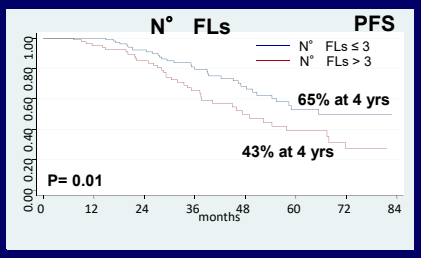
	Grade
Active multiple myeloma	
^{18}F-FDG PET/CT should be considered as part of the initial investigations in patients with newly diagnosed multiple myeloma because it provides information useful for prognostication and allows to more carefully assess the bulk of the disease, particularly in patients with extramedullary sites of the disease; assessing the bulk of the disease with ^{18}F-FDG PET/CT also applies to patients with relapsed or refractory multiple myeloma	B
In patients with newly diagnosed multiple myeloma, with or without EMD, and more than three focal lesions, ^{18}F-FDG PET/CT identifies subgroups of patients with unfavourable outcomes; controversies exist about the prognostic role of SUV_{max}	B
^{18}F-FDG PET/CT is now the preferred technique for evaluating and monitoring response to therapy; metabolic changes assessed by ^{18}F-FDG PET/CT provide an earlier evaluation of response compared with MRI	A
^{18}F-FDG PET/CT should be coupled with sensitive bone marrow-based assays as part of minimal residual disease detection inside and outside the bone marrow	B

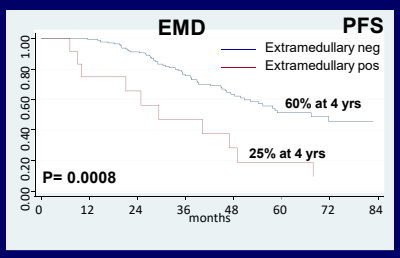
Cavo M et al, Lancet Oncology 2017

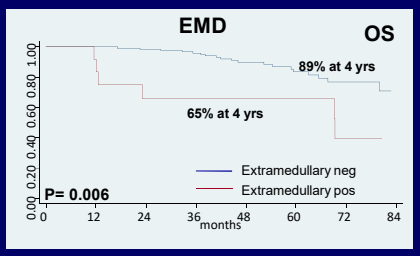
Prognostic value of PET/CT at diagnosis in NDMM transplant-candidates

N° OF FLs, SUV VALUE, EMD









Zamagni E. et al, Blood 2011

How to proceed in the clinic with a NDMM patient?

- **Order of preference:**
- **PET/CT: the CT part is valid for lytic lesions detection and PET can be useful to evaluate the response to treatment**
- **WBLDCT: valid for lytic lesions**
- **X-ray: if other assessments are not available**

- **If doubt lesions on CT or PET/CT: close follow-up every 3-6 months and/or biopsy of the lesion**
- **Oseoporosis per se in the absence of lytic lesions is not sufficient for CRAB**

Rajkumar V. et al., Lancet Oncology 2014

Magnetic Resonance Imaging

- MRI is a non-invasive technique which provides detailed information about bone marrow involvement
  - patterns: focal, diffuse, variegated, normal
  - discriminates normal vs myeloma marrow infiltration (osteoporotic vs malignant fractures)
- A WB-MRI (or MRI of the spine and pelvis) is mandatory in all patients with a presumed diagnosis of solitary plasmacytoma and in patients with smoldering MM
- It provides accurate illustration of spinal cord and/or nerve root compression, soft tissue extension, avascular necrosis

Terpos et al. J Clin Oncol 2011;29:1907-15

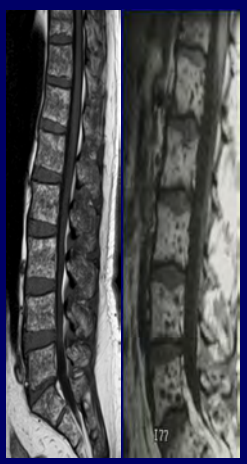
MRI patterns in MM

Focal lessions: 40% of NDMM

52% of 267 patients with normal skeletal survey had focal lesions on MRI

Diffuse pattern: 20%

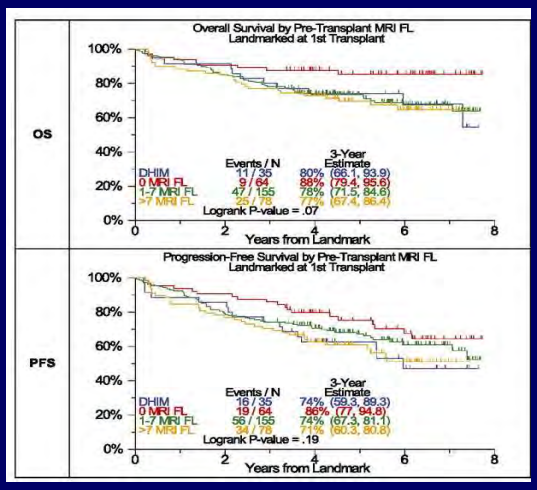
Variegated pattern: 4%



Moulopoulos & Koutouilidis. Bone Marrow MRI (Springer) 2015

Walker et al. J Clin Oncol 2007;25:1121-8

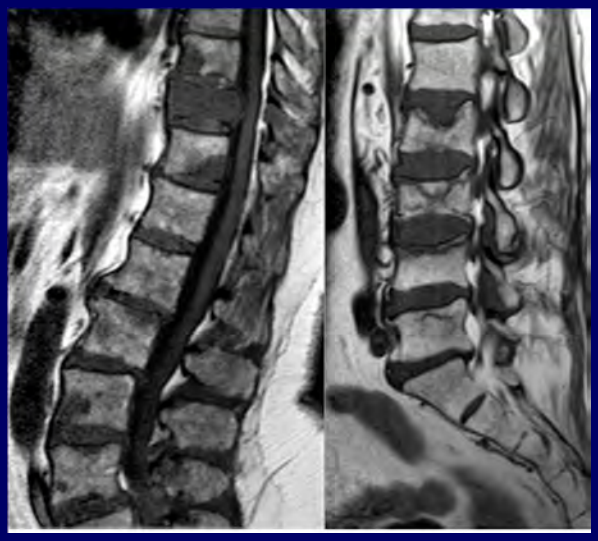
Prognostic value of MRI focal lesions at diagnosis



Usmani et al. Blood 2013;121:1819-23

Magnetic Resonance Imaging

due to myeloma osteoporotic



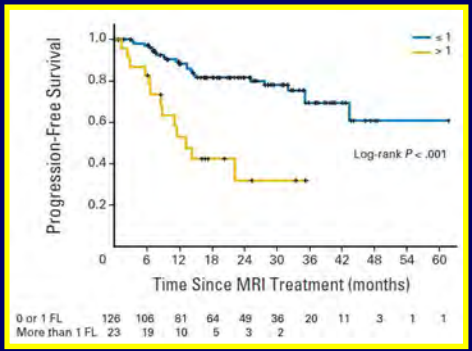
Magnetic Resonance Imaging

- MRI is a non-invasive technique which provides detailed information about bone marrow involvement
  - patterns: focal, diffuse, variegated, normal
  - discriminates normal vs myeloma marrow infiltration (osteoporotic vs malignant fractures)
- A WB-MRI (or MRI of the spine and pelvis) is mandatory in all patients with a presumed diagnosis of solitary plasmacytoma and in patients with smoldering MM
- It provides accurate illustration of spinal cord and/or nerve root compression, soft tissue extension, avascular necrosis

Terpos et al. J Clin Oncol 2011;29:1907-15

Prognostic value of WBMRI in SMM: **biomarker** of malignancy

- 149 patients
- FL in 28%
- >1 focal lesion in 15% [23 patients]
- 9/23 would have been missed by axial examination only
- median PFS 13 months vs not reached



Hillengas et al. JCO 2010;28:1606-10

Imaging techniques at diagnosis in Myeloma

	WBLDCT	PET/CT	MRI
PROS	• Sensitivity and specificity • CT-guided biopsy, surgery, RT planning • Can depict EMD, BM involvement, lytic lesions • **Rapid acquisition time, low radiation dose (3-5 mSV)** • **Intermediate cost**	• Sensitivity and specificity • Optimal to assess **EMD** • Can depict lytic lesions (CT part) • **Can assess tumor burden and disease metabolism** • **Prognostic significance of FLs and SUV**	• Sensitivity and specificity • **No radiation** • **Gold standard for detection of diffuse BM involvement** • Optimal for CNS imaging • Gold standard for differential diagnosis between osteoporotic and pathological fractures • Can depict EMD (WBMRI) • Prognostic significance of FLs
CONS	• Sub-optimal for diffuse BM involvement • **Few data/unclear prognostic significance of lesion number**	• **Sub-optimal for diffuse BM involvement** • High cost , availability • Radiation dose intermediate (10 mSV)	• Imaging time (in particular axial) • **No detection of lytic lesions: not enough to define end organ damage (MDE)** • High cost , availability

How to proceed in the clinic with a NDMM patient?

- **Order of preference:**
  - **PET/CT: the CT part is valid for lytic lesions detection and PET can be useful to evaluate the response to treatment**
  - **WBLDCT: valid for lytic lesions**
  - **X-ray: if other assessments are not available**

- **If doubt lesions on CT or PET/CT: close follow-up every 3-6 months and/or biopsy of the lesion**
- **Oseoporosis per se in the absence of lytic lesions is not sufficient for CRAB**
- **MRI: mandatory in solitary plasmacytoma, SMM, spinal cord compression,..**

Rajkumar V. et al., Lancet Oncology 2014

What is the role of imaging in Myeloma?

- Precise identification of bone disease, as sign of **organ damage and need to start treatment**
- Identification of sites of **extra-medullary disease** (total body techniques)
- Differential diagnosis between localized disease **(BSP)** and systemic disease **(MM)**
- Correct identification of sites of bone disease at risk of complications (fractures, neurological complications) (MRI gold standard)
- **Correct follow up of the patients after treatment: Metabolic response to treatment**

Zamagni E. et al, BJH 2012

Axial MRI or DWI-WBMRI vs WBXR in Multiple Myeloma

•Detection of FLs: MRI 74%, WBXR 56%; 52% patients with normal WBXR had FLs at MRI [1]

•WBMRI detected higher number of lesions in 37% of the patients; 18% patients WBXR negative, WBMRI positive [2]

•Clear superiority of axial MRI and WBMRI in: spine, pelvis, sternum and ribs ($P < 0,001$)

•Axial MRI equally effective as PET/CT in detecting FLs ($P= 0,33$)[3]

•Role of DWI-WBMRI in detecting the diffuse pattern[4,5]

….but no detection of lytic lesions

Comparison of modern and conventional imaging techniques in establishing multiple myeloma-related bone disease: a systematic review

COMPARISON OF PET, PET/CT, MRI OR CT vs WBXR AT STAGING

- 32 directly comparison studies, prospective and retrospective, 1661 patients
- Index test vs reference standard: detection rate
- Quality assessment of diagnostic studies
- All index tests had sensitivity above 0,9 as compared to WBXR (low false negative). Fewer additional lesions detected by PET/CT and MRI as compared to WBLDCT WBLDCT can replace WBXR
- Modern imaging techniques detected fewer lesions in the skull

Regelink J. et al., BJH 2013

PROGNOSTIC VALUE OF PET/CT AT DIAGNOSIS IN ASCT CANDIDATES

New response criteria: IMWG 2016

Standard IMWG Response criteria[6]	*sCR (stringent complete response)*	CR as defined below PLUS Normal FLC ratio[10] AND Absence of clonal cells in bone marrow biopsies by immunohistochemistry (κ/λ ratio ≤4:1 or ≥1:2 for κ and λ patients, respectively, after counting ≥100 PCs)[7]
	CR (complete response)	Negative immunofixation on the serum AND urine AND[11] Disappearance of any soft tissue plasmacytomas AND <5% plasma cells in bone marrow aspirates (If cellular MRD is to be performed, the first BM aspirate should be sent to MRD and morphological evaluation is not mandatory)

	Response subcategory	Response criteria [1]
IMWG MRD negativity criteria (Requires CR as defined below)	*Sustained MRD negative*	MRD negative in the marrow (Next-generation flow or Next-generation sequencing) and by imaging as defined below, confirmed one year apart.[2] Subsequent evaluations can be used to further specify the duration of negativity (e.g., MRD negative @ 5 years etc)
	Flow MRD-negative	Absence of phenotypically aberrant clonal plasma cells by next-generation flow cytometry[4] on bone marrow aspirates using the EuroFlow standard operation procedure for MRD detection in MM (or validated equivalent method) with a minimum sensitivity of 1 in 10^5 nucleated cells or higher
	Sequencing MRD negative	Absence of clonal plasma cells by next generation sequencing on bone marrow aspirates in which presence of a clone is defined as less than 2 identical sequencing reads obtained after DNA sequencing of bone marrow aspirates using the Lymphosight® platform (or validated equivalent method) with a minimum sensitivity of 1 in 10^5 nucleated cells[5] or higher
	Imaging+ MRD-negative	MRD negative as defined by Next-generation flow or Next-generation sequencing **PLUS** Disappearance of every area of increased tracer uptake found at baseline or a preceding PET/CT[3]

Role of ^{18}F-FDG PET/CT in the diagnosis and management of multiple myeloma and other plasma cell disorders: a consensus statement by the International Myeloma Working Group

Michele Cavo, Evangelos Terpos, Cristina Nanni, Philippe Moreau, Suzanne Lentzsch, Sonja Zweegman, Jens Hillengass, Monika Engelhardt, Saad Z Usmani, David H Vesole, Jesus San-Miguel, Shaji K Kumar, Paul G Richardson, Joseph R Mikhael, Fernando Leal da Costa, Meletios-Athanassios Dimopoulos, Chiara Zingaretti, Niels Abildgaard, Hartmut Goldschmidt, Robert Z Orlowski, Wee Joo Chng, Hermann Einsele, Sagar Lonial, Bart Barlogie, Kenneth C Anderson, S Vincent Rajkumar, Brian G M Durie, Elena Zamagni

Table 6: Recommendations for use of 18F-FDG PET/CT in MM

Recommendation	Grade
Active MM:	
18F-FDG PET/CT can be considered as part of the initial workup in patients with newly diagnosed MM since it provides information useful for prognostication and allows to more carefully assess the bulk of the disease, particularly in patients with extramedullary sites of the disease. This latter indication for use of 18F-FDG PET/CT applies also to patients with relapsed/refractory MM	B
In newly diagnosed MM, EMD and >3 FLs on 18F-FDG PET/CT identify subgroups of patients with unfavorable outcomes, particularly those who are candidates to receive upfront ASCT. Controversies exist about the prognostic role of SUV_{max}	B
18F-FDG PET/CT is by now the preferred technique for evaluating and monitoring response to therapy. Metabolic changes assessed by 18F-	A

FUTURE STEPS

•Validation of the criteria in independent series of patients (FORTE GIMEMA trial) and cross-validation with french IMAJEM study (IFM 2009 trial)

•Definition, by combined analysis of IMPeTUs and CASSIOPET, of 3 interpretative criteria:

- FLs at diagnosis
- High BM uptake
- PET CR

Italian Myeloma criteria for Pet Use

IMPeTUS

International Myeloma criteria for Pet Use

Open issues

•How to incorporate imaging into risk-stratification at diagnosis (for both smoldering and symptomatic MM) and imaging- MRD after treatment; what is the optimal follow-up with PET ?

•What to do with persistent focal lesions after systemic therapy? What is the precise biology of persistent FLs?

•Novel biomarkers for PET/CT (C-methionine[1,2],C-acetate[3],C-choline[4,5,6],MM specific tracers)

•Newer techniques (PET/MRI)

CONCLUSION

- **Newer imaging techniques** have proved reliable tools in the staging and as predictors of outcome in MM patients, both in early stage and active disease and should be used in the work-up of patients
- **PET/CT and DWI-MRI** are the favorite techniques for assessing and monitoring response to therapy and are becoming complementary investigation tools for detecting minimal residual disease, going beyond the conventionally defined CR level
- **Comparative studies** between PET/CT and functional MRI are warranted
- **Implementation of prospective clinical trials** with newer imaging techniques will help to adress several issues, standardize the interpretation of the results and optimize the use of these promising tools

How to Perform an Appropriate Protein Screening and Decisions on Follow-up

Joan Bladé
Unidad de Amiloidosis y Mieloma
ICMHO, Hospital Clínic, Barcelona

Santiago de Chile, 11 de Agosto, 2017

Concept

- Clonal proliferation of mature B lymphocytes (plasma cells and/or lymphoplasmocytoid cells) resulting in a monoclonal production of an homogenous immunoglobulin (M component).

Classification

1. **Multiple myeloma (MM) and variants**
   - Smoldering myeloma
   - Plasma cell leukemia
   - Osteosclerotic myeloma (POEMS)
   - Non-secretory myeloma
   - Solitary plasmacytoma (bone or extramedullary)
2. **Waldenström`s Macroglobulinemia (WM)**
3. **Immunoglobulin light chain amyloidosis or primary amyloidosis (AL)**
4. **MG of undetermined significance (MGUS)**

Incidence

1. MM → 4-5 new cases/100.000 person
2. WM → 0.5 new cases/100.000 person
3. AL → 1 new case/100.000 person
4. MGUS
   - Patients >50 years-old → 3%
   - Patients >70 years-old → 5%

MM. Diagnostic

	MGUS	SMM	MM
BMPC (%)	<10 and	≥10 and/or	≥10*
M-protein (g/L)	<30	≥ 30	Any
Symptoms	No	No	Yes**

*Clonal
**Hypercalcemia, renal failure, anemia, bone lytic lesions, recurrent bacterial infections and/or extramedullary plasmocytomas

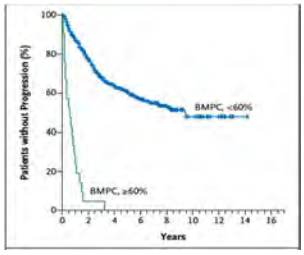
Indicators of Increasing Disease and/or End-organ Dysfunction MM-related (**CRAB**)

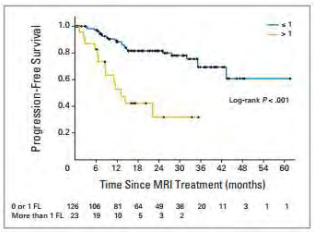
- Hyper**C**alcemia (> 11.5 mg/dL)
- **R**enal failure (↑ serum creatinine by ≥ 2 mg/dL)
- **A**nemia (↓ Hb by > 2 g/dL or < 10 g/dL)
- Increase (> 50% and at least 1 cm) in size of existing **B**one lesions or plasmacytomas
- Other: hyperviscosity, development of new soft tissue plasmacytomas or bone lesions

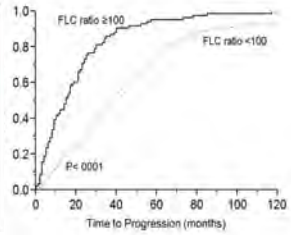
*Rajkumar *et al*, Blood 2011; 117: 4691-5.

Ultra-High Risk Smoldering Myeloma

(>80% at 2 years)







BMPC ≥ 60%

Median TTP: 7 months

Rajkumar SV et al; NEJM, 2011

> 1 FOCAL LESIONS IN MRI

Median TTP: 13 mos.

Hillengass J et al; JCO, 2011

sFLC RATIO ≥ 100

Median TTP: 15 mos.

Larsen JT et al; Leukemia, 2012

Rajkumar *et al*, Lancet Oncol 2014

Multiple Myeloma Workup

1. Complete blood count and differential; peripheral blood smear
2. Chemistry screen, including creatinine, calcium, LDH, beta2-microglobulin
3. Serum protein electrophoresis and immunofixation
3. Serum immunoglobulins (nephelometric quantification)
4. Measurement of serum free light chain (FLC)
5. 24-hour urine collection for electrophoresis and immunofixation
6. Bone marrow aspirate: morphology, immunophenotype and cytogenetics by FISH (13q, t(11;14); t(4;14); t(14;16); 17p)
7. Radiologic skeletal survey

---

10. CT and/or MRI if clinically needed
11. PET/CT in patients with suspected extramedullary disease

IMWG definition of measurable disease and recommended measurements

Definitions of measurable disease
Response criteria to all categories of response except CR are aplicable only to patients who have “measurable” disease defined by at least one of the following measurements:
– Serum M-protein ≥ 10 g/L – Urine M-protein ≥ 200 mg/24h – Involved FLC level ≥ 100 mg/L plus an abnormal FLC ratio
Measurement of the M-protein
– Serum M-protein: quantitated using densitometry on SPEP, unless than SPEP is unrelaible, which should be explicitly reported – Urine M-protein: quantitated using 24h-UPEP only – Patients with “measurable disease” should be followed monthly by both SPEP and UPEP for response assessment while on therapy

IMWG Uniform Response Criteria

sCR	CR as defined below plus normal FLC ratio plus absence of bone marrow clonal plasma cells
CR	Negative IF on serum and urine, disappearance of any soft-tissue plasmacytomas and <5% BMPC
VGPR	≥ 90% serum M-protein decrease and urine M-protein <100 mg/24h
PR	≥50% serum M-protein reduction plus ≥90% urine M-protein decrease or to <200 mg/24hrs plus ≥50% reduction in the size of soft-tissue plasmacytomas

IMGW criteria for disease progression

Increase of ≥25% from lowest level in one or more of the following*:

- – Serum M-protein (the absolute increase must be ≥ 5 g/L)
- – Urine M-protein (the absolute increase must be ≥200 mg/24hrs)
- – Bone marrow plasma cell percentage (the absolute increase must be ≥ 10%)
- – Development of new bone lesions or soft-tissue plasmacytomas or definite increase in the size of existing bone lesions or soft-tissue plasmacytomas
- – Development of hypercalcemia (corrected serum calcium >11.5 mg/dL) attributed to the plasma cell disorder

Modified from Durie et al (Leukemia 2006; 20:1467-1473)
*All categories of progression require two consecutive assessments made at any time
**For progressive disease, serum M-protein increases of > 10 g/L are sufficient to define progression if the starting serum M-component was ≥ 50 g/L

Monitoring of Patients under Active Therapy

Induction and/or Maintenance

Before every cycle

- CBC, chemistry including serum EP and 24-hours protein urine excretion with EP
- If EP negative → serum and urine IF and, if negative, bone marrow aspirate in order to confirm CR

Follow-up in Patients with Multiple Myeloma Off-Therapy

After conventional therapy: (patients with stable response)	After HDT/SCT:
– First year: every 2 months – Beyond first year: every 3 months – Beyond 5 years: every 4 months	– First 6 months: every 2 months – Two first years: every 3 months – From 2 to 5 years: every 4 months – Beyond 5 years: every 6 months

CLÍNIC BARCELONA Hospital Universitari

Patients with asymptomatic relapse or PD*

– After conventional therapy: every 2 months

– After HDT/SCT: every 3 months

* Unless abrupt PD

CLÍNIC BARCELONA Hospital Universitari

Lab work-up during follow-up off therapy

1. Complete blood count and chemistry
2. Serum total protein and EF
3. 24-hours urine protein measurement with EF
4. Serum and urine immunofixation and serum FLC every 2 visits only in patients in CR
5. Bone marrow aspirate and/or imaging techniques only when clinically indicated
   - Bone marrow: unexplained cytopenias (medullary progression, MDS)
   - Imaging: bone or extramedullary progression

Oligoclonal Bands

1. Monoclonal protein ≠ original
2. In patients in CR (ASCT, novel therapies)
3. Faint small bands in the gamma region, usually non-quantifiable
4. More frequent: IgG-k, IgG-λ, IgM (k or λ), k or λ light chains, rarely IgA
5. Frequently multiple and fluctuating
6. Never show a significant increase
7. Tipically persistent all along the CR duration and their disappearance usually precedes relapse

Is it time to implement minimal residual disease (MRD) in multiple myeloma management?

What should be the goal of treatment in MM?

To search for an appropriate balance between treatment efficacy, toxicity & costs

- To eradicate the all tumor cells
- To achieve and maintain the best possible response

- *MGUS signature: <10% of patients may achieve a functional cure with persistent clonal cells*
  - *Persistent MGUS-like clones after therapy* [1,2]
  - *Immune surveillance of residual clones* [3,4]

4. Bryant C, et al. Blood Cancer J. 2013;3:e148

Evidence supporting this statement

CR a surrogate marker for survival

The better the quality of the response the longer the survival

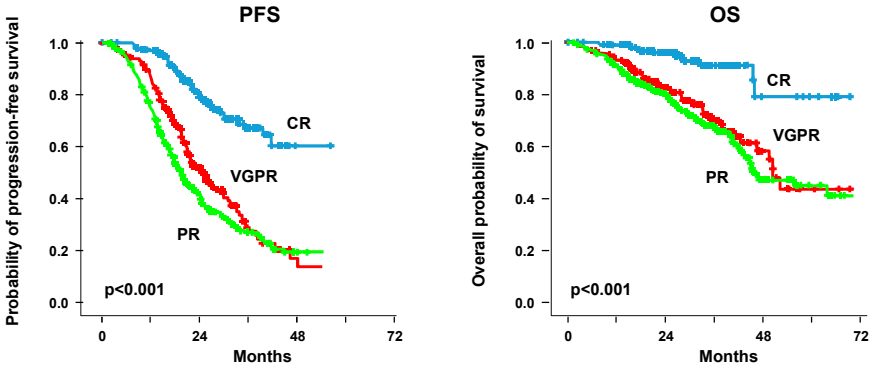
Clinical impact of CR in transplant-eligible MM

	CR	nCR	PR	PD
Median PFS, months	61	40	34	13
Median OS, months	NR	NR	61	15

Lahuerta JJ et al. J Clin Oncol 2008;26:5775–5782

Clinical impact of CR in elderly MM

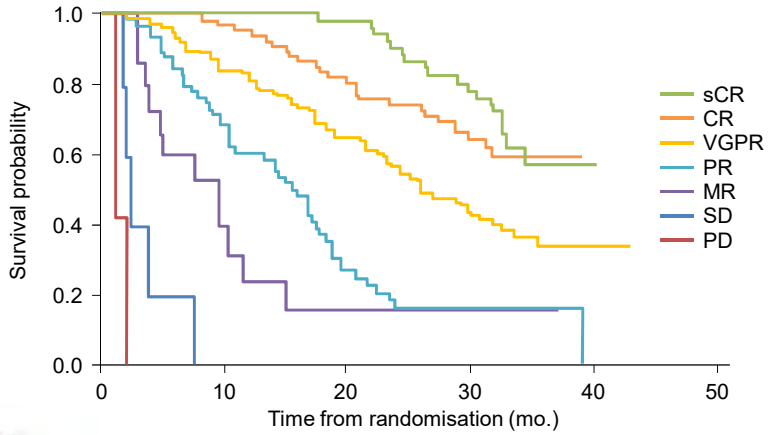
- Retrospective analysis: 3 randomized European trials of GIMEMA and HOVON groups (n=1175)
- First-line treatment: MP (n=332), MPT (n=332), VMP (n=257), VMPT-VT (n=254)



Significant benefit also seen when analysis is restricted to patients >75 years old

Gay F et al. Blood 2011;117:3025-3031

Clinical impact of CR in relapsed/refractory MM



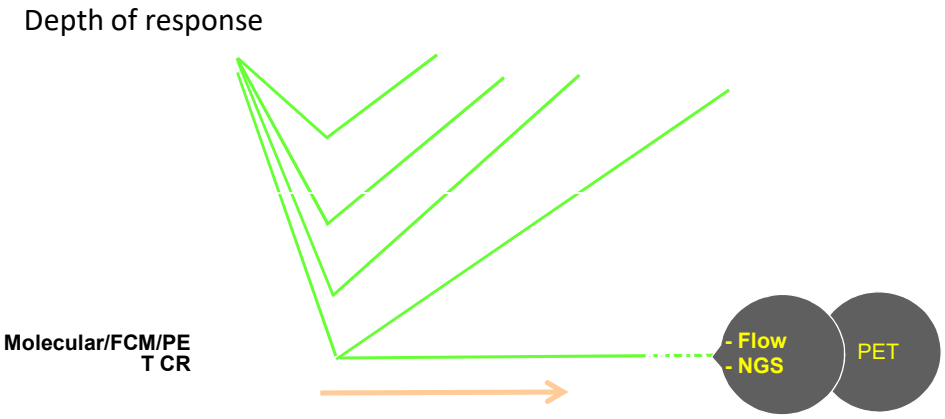
Suppl. to Stewart AK, et al. N Engl J Med. 2015;372:142–52

CR criteria in MM are suboptimal

- **Negative Immunofixation & < 5% PC in BM**

More sensitive techniques are needed…
MRD Techniques

Which level of response should be measured?



More sensitive techniques are needed…..

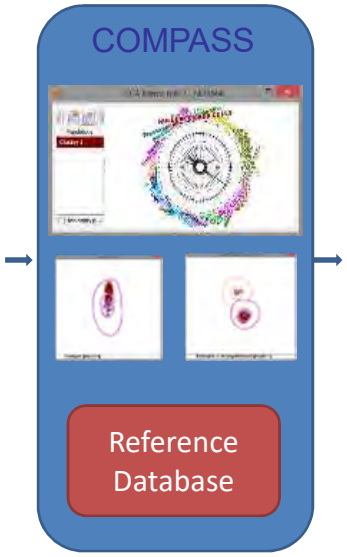
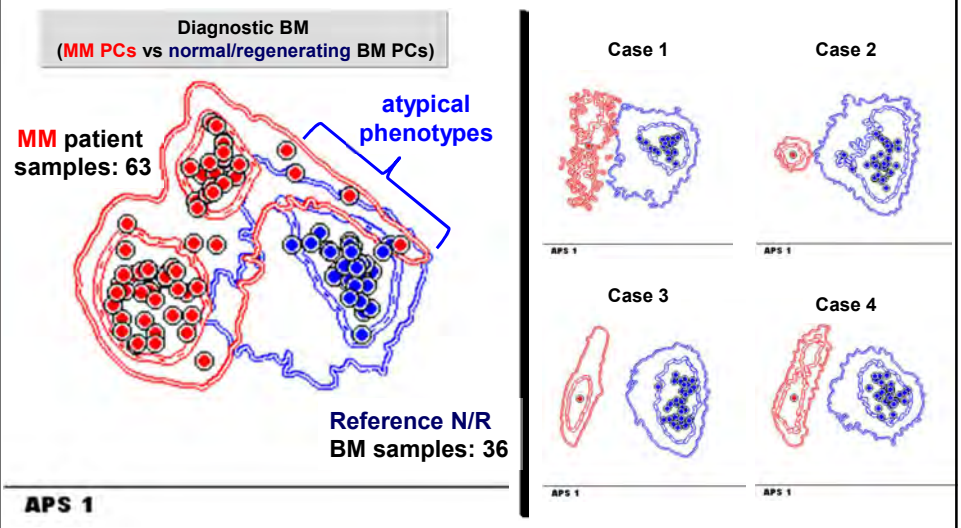
Next generation Flow-MRD monitoring in MM

*An **optimized** 2-tube 8-color monoclonal antibody panel was constructed **after five rounds of design-evaluation-and-redesign**. Additionally, a bulk-lysis sample preparation procedure was established for acquisition of **≥10^7 cells/patient**, and novel software tools for **automated analysis***



Flores-Montero J, et al. Leukemia. 2017. doi: 10.1038/leu.2017.29

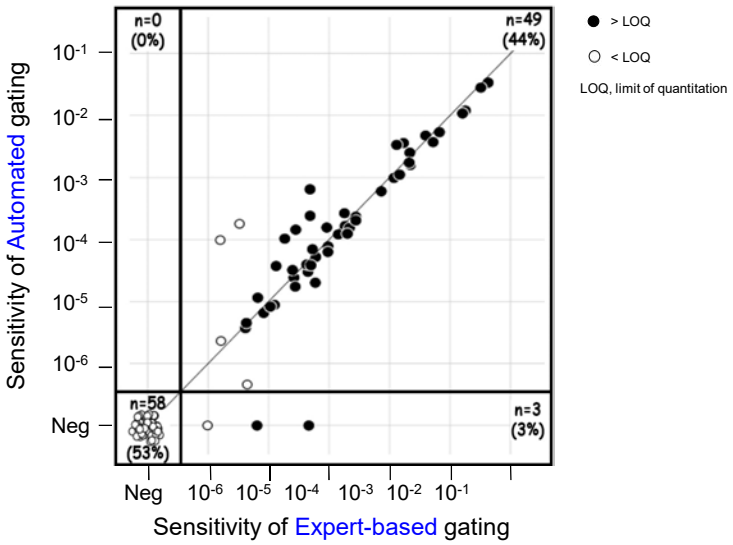
Next generation Flow-MRD monitoring in MM
- applicable to all patients -



New software: Principal component analysis: clusters

Flores-Montero J, et al. Leukemia. 2017. doi: 10.1038/leu.2017.29

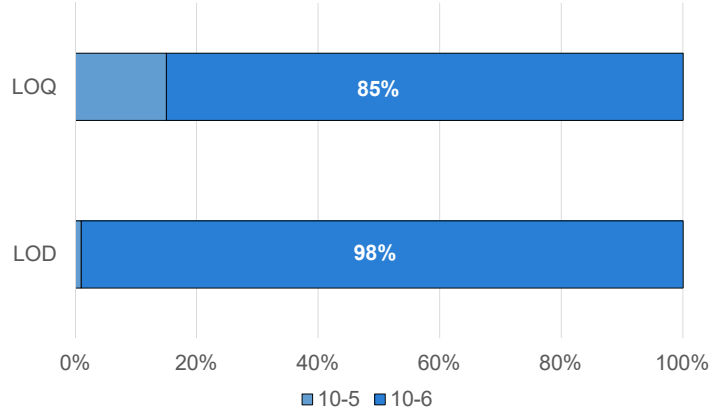
NGF expert (manual) vs automated analysis



TIME OF DATA ANALYSIS (automated vs expert-based analysis):
8h 52m vs. 19h 39m (4m 50s vs. 10m 43s/case)

Flores-Montero J, et al. Leukemia. 2017. doi: 10.1038/leu.2017.29

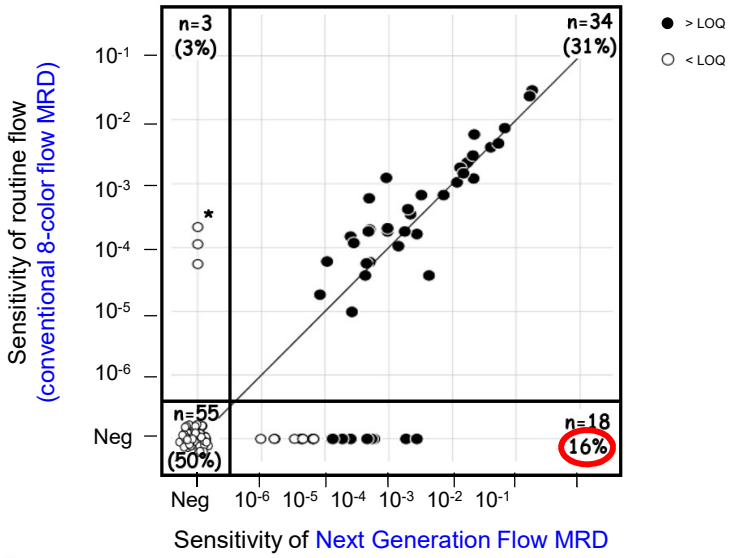
NGF reaches 10^{-6} sensitivity in the vast majority of MM patients (GEM2012MENOS65)



LOQ (level of quantitation) : 50 cells / total nucleated viable cells
LOD (level of detection): 20 cells / total nucleated viable cells

Flores-Montero J, et al. Leukemia. 2017. doi: 10.1038/leu.2017.29

NGF vs 2nd generation flow



* 2 samples proven polyclonal by Cylg staining

Flores-Montero J, et al. Leukemia. 2017. doi: 10.1038/leu.2017.29

Next generation Flow-MRD monitoring in MM

ADVANTAGES

- World-wide availability
- High applicability: 100%
- Fast for clinical decisions (<4h)
- Relatively simple
- Quantitative (% myeloma PCs)
- high-sensitivity ($3x10^{-6}$)
- Assessment of non-PC BM cell compartments: sample QC
- Standardized (EuroFlow)
- Cost (250 euro/sample)

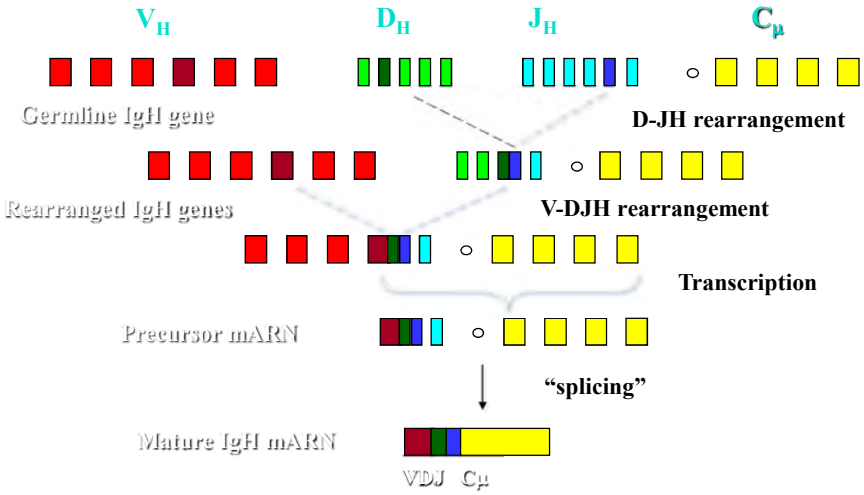
LIMITATIONS (?)

- Fresh (<48h) samples required
- ~~Less sensitive than molecular methods~~
- ~~Lack of standardization~~
- Heterogeneous BM infiltration or extramedullary disease

Achieving a Global Standard for MRD Testing

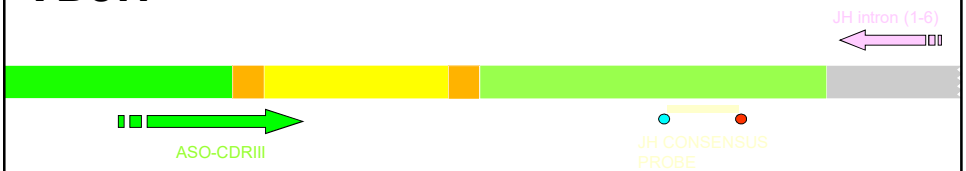
Over 40 laboratories in 16 countries have implemented NGF

Immunoglobulin heavy (IgH) chain gene rearrangement

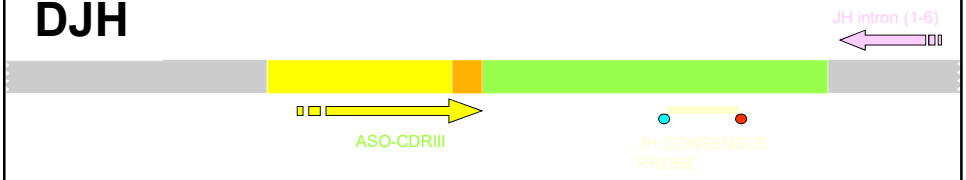


REAL-TIME strategy for *IGH* rearrangements

VDJH*

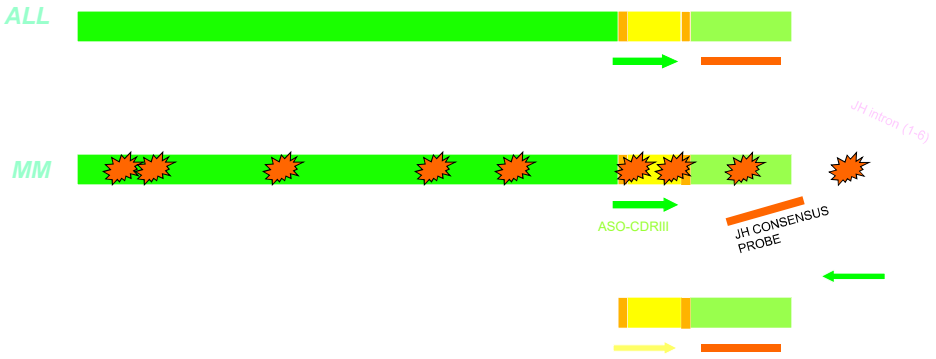


DJH



Verhagen et al, Leukemia 2000; 14:1426

PITFALS FOR THE RQ-PCR CONSENSUS IN MM



MM: Somatic Mutations in VDJH: 100% (invalid for consensus primers), while in DJH 12%

Gonzalez et al Leukemia 2003, Hematologica 2005

1.Use several targets: VDJH, DJH, Kde, 2.*Clone PCR products* (time & labor consuming)

3.Design patient-specific primers, both forward and reverse *4. Design patient-specific probes* (expensive)

Prognostic value of MRD evaluation by PCR (Qualitative & semi-Q) in MM

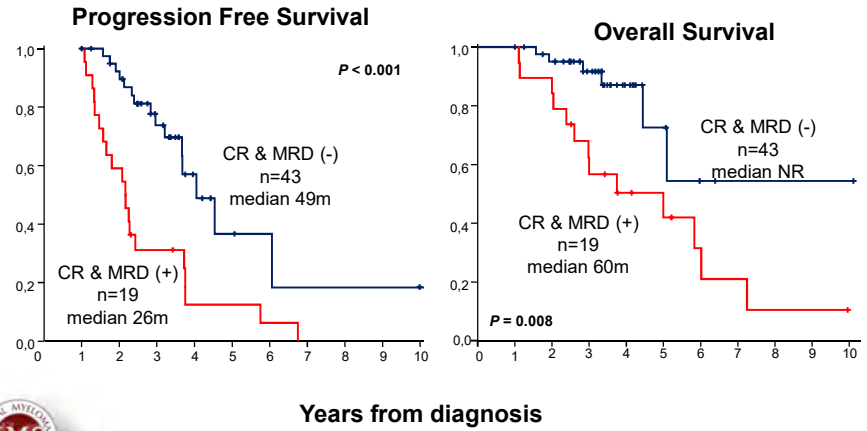
MRD monitoring using ASO-PCR

31% of the patients in conventionally-defined CR had positive MRD by ASO-PCR



Puig N, et al. Leukemia. 2014;28(2):391-7

MRD monitoring using ASO-PCR

PROS

- Highly-specific detection of clonality
- Sensitivity (10^{-6})
- Detection of putative CSCs
- Reproducibility among centers
- Does not require immediate sample processing
- Standardized (EuroMRD)

CONS

- Limited applicability (~60%)
- Limited value in patients with patchy BM infiltration and/or extramedullary disease
- Does not measure subclonal dynamics
- No assessment of sample quality
- Requires diagnostic sample
- Turnaround time & time consuming
- Cost (increased by baseline sample)

MRD supersedes CR

and could met some of the key requirements for a surrogate endpoint such as:

- move the PFS of patients in remission from 3-5 years to 8-10 years
- independence from treatment
- predict different outcomes upon different MRD-negative rates
- useful in all patient' subgroups
- reliable and widely available techniques

IMWG Criteria for MRD in Multiple Myeloma

	Response subcategory	Response criteria
IMWG MRD negativity criteria (Requires CR as defined below)	Sustained MRD negative	MRD negative in the marrow (Next-generation flow or Next-generation sequencing) and by imaging as defined below, confirmed one year apart. Subsequent evaluations can be used to further specify the duration of negativity (e.g., MRD negative @ 5 years etc)
	Imaging MRD-negative	MRD negative as defined below (Next-generation flow or Next-generation sequencing) PLUS Disappearance of every area of increased tracer uptake found at baseline or a preceding PET/CT[3]
	Flow MRD-negative	Absence of phenotypically aberrant clonal plasma cells by next-generation flow cytometry[4] on bone marrow aspirates using the EuroFlow standard operation procedure for MRD detection in MM (or validated equivalent method) with a minimum sensitivity of 1 in 10^5 nucleated cells or higher
	Sequencing MRD negative	Absence of clonal plasma cells by next generation sequencing on bone marrow aspirates in which presence of a clone is defined as less than 2 identical sequencing reads obtained after DNA sequencing of bone marrow aspirates using the Lymphosight® platform (or validated equivalent method) with a minimum sensitivity of 1 in 10^5 nucleated cells[5] or higher

New Sensitive tests for diagnosis, prognosis and to monitor treatment efficacy

- Myeloma Diagnosis and monitoring can not remain in the **Paleolithic era** (….morphology and conventional Radiology)
- In MM you need to evaluate MRD **inside and outside** the BM
- New techniques require **standardization** (Precaution for treatment decisions…!!)
- There are **singular MM subtypes** ('rapid responders but early relapsing' or with 'MGUS profile'): in these the standard response criteria do not correlate with outcome

New Sensitive tests for diagnosis, prognosis and to monitor treatment efficacy (II)

- New techniques are **expensive**…. MRD follow-up study (1200 $), PET (1300$)…….but compare this with the costs of just one additional cycle of novel drugs (sometimes no needed)……
- MRD techniques will contribute both to a better **definition of response** and to **monitor the efficacy** of intensification and maintenance therapies…may be critical **to tailor treatment** to avoid both under & over treatments
- But….Please do not forget **Standard techniques**

Amgen					x	x	
Takeda					x	x	

Objectives

- What is Smouldering Myeloma?
- Diagnosis of Smouldering Myeloma and differential diagnosis with other plasma cell disorders
- Why do we call it “Smouldering” Myeloma?
- What is the mechanism of transition from SMM to MM?
- What is the risk of progression to Myeloma?
- Is it possible to evaluate the individual risk of progression to Myeloma?
- What is the optimal management for Smouldering Myeloma patients?

Smouldering MM: diagnostic criteria

Study	M Protein (g/dl)	Bone Marrow Plasma Cells (%)
Kyle and Greipp, 1980	≥ 3	≥ 10
Alexanian et al, 1988	> 2	
Wisloff et al, 1991	IgA > 1,5; IgG > 3	
Facon et al, 1995		
Weber et al, 1[illegible]		-
C[illegible]	[illegible] IgG 3.6-6.9	>10
	[illegible] chain proteinuria > 1 g/24h	
Ro[illegible] [illegible], 2003&	≥ 3	≥ 10
IMWG, 2003∞	≥ 3	≥ 10

*Either diagnostic criterion is acceptable, &Both diagnostic criteria are required, ∞Either or both diagnostic criteria are acceptable

On the basis of a series of six patients who met the criteria for multiple myeloma (MM) but whose disease did not have an aggressive course and they did not progress

Smouldering MM: diagnostic criteria

Study	M Protein (g/dl)	Bone Marrow Plasma Cells (%)
Kyle and Greipp, 1980	≥ 3	≥ 10
Alexanian et al, 1988	> 2	-
Wisloff et al, 1991	IgA > 1,5; IgG > 3	-
Weber et al, 1997	> 2,5	-
Facon et al, 1995	-	>15
Cesana et al, 2002*	IgA 2.1-4.9; IgG 3.6-6.9 Light chain proteinuria > 1 g/24h	>10
Rosiñol et al, 2003&	≥ 3	≥ 10
IMWG, 2003∞	≥ 3	≥ 10

**Either diagnostic criterion is acceptable*
&Both diagnostic criteria are required
∞Either or both diagnostic criteria are acceptable

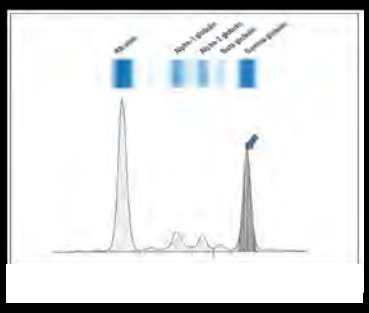
**Either diagnostic criterion is acceptable*
&Both diagnostic criteria are required
∞Either or both diagnostic criteria are acceptable

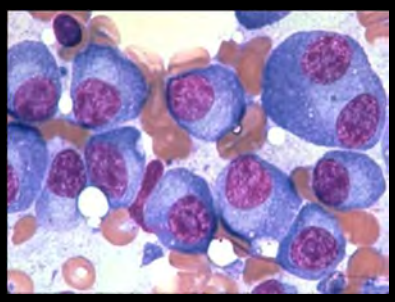
Clinical Case

- 52 years-old man
- Asymptomatic.
- Routine analysis
- **Elevated total serum proteins (10.2 g/dL) with normal albumin**
- Hemogram and biochemistry normal

Clinical Case

- 52 years-old man
- Asymptomatic.
- Routine analysis
- **Elevated total serum proteins (10.2 g/dL) with normal albumin**
- Hemogram and biochemistry normal





Smouldering MM: diagnostic criteria

	Smouldering Multiple Myeloma (SMM)
Monoclonal component	≥ 3 g/dL serum
	AND/OR
Bone Marrow Plasma Cells (%)	10-60%
	AND
Mieloma-defining event [a]	Absent

a) Myeloma Related Organ or Tissue Impairment (end organ damage) related to Plasma cell proliferative process: anemia with 2 g/dL below the normal level or <10 g/dL, or serum calcium level >10 mg/L (0.25 mmol/L) above normal or >110 mg/dL (2.75 mmol/L), or lytic bone lesions or osteoporosis with compressive fractures, or renal insuficiency (creatinine >2 mg/dL or 173 mmol/L),[CRAB: Calcium increase, Renal impairment, Anemia and Bone lesion] or symptomatic hyperviscosity,, amyloidosis or recurrent bacterial infections (>2 episodes in 12 m).
b) For symptomatic multiple myeloma, a minimum level of M-component or BM plasma cell infiltration (although usually it is >10%, is not required, provided than this two features coexists with the presence of end organ damage

Rajkumar SV et al. Lancet Oncology 2014

Objectives

- What is Smouldering Myeloma?
- Diagnosis of Smouldering Myeloma and differential diagnosis with other plasma cell disorders
- Why do we call it “Smouldering” Myeloma?
- What is the mechanism of transition from SMM to MM?
- What is the risk of progression to Myeloma?
- Is it possible to evaluate the individual risk of progression to Myeloma?
- What is the optimal management for Smouldering Myeloma patients?

MGUS/SMM/MM: diagnostic criteria

	Monoclonal Gammopathy of uncertain significance (MGUS)	Smouldering Multiple Myeloma (SMM)	Symptomatic Multiple Myeloma
Monoclonal component	< 3 g/dL serum	≥ 3 g/dL serum	Present (*serum/urine*)
	AND	AND/OR	AND
Bone Marrow Plasma Cells (%)	< 10%	10-60%	> 10%[b]
	AND	AND	AND
Myeloma-defining event	Absent	Absent	Present

Hypercalcaemia: serum calcium >0.25 mmol/L (>1 mg/dL) higher than the upper limit of normal or >2.75 mmol/L (>11 mg/dL)
Renal insufficiency: creatinine clearance <40 mL per min† or serum creatinine >177 µmol/L (>2 mg/dL)
Anaemia: haemoglobin value of >20 g/L below the lower limit of normal, or a haemoglobin value <100 g/L
Bone lesions: one or more osteolytic lesions on skeletal radiography, CT, or PET-CT‡

Rajkumar SV. Lancet Oncology 2014

Smouldering MM: diagnostic criteria

	Monoclonal Gammopathy of uncertain significance (MGUS)	Smouldering Multiple Myeloma (SMM)	Symptomatic Multiple Myeloma
Monoclonal component	< 3 g/dL serum	≥ 3 g/dL serum	Present (*serum/urine*)
	AND	AND/OR	AND
Bone Marrow Plasma Cells (%)	< 10%	10-60%	> 10%[b]
	AND	AND	AND
Mieloma-defining event	Absent	Absent	Present

Concomitant diseases that can mimic MM:
-Increase of serum Cr due to diabetes or hypertension
-Anemia due to idon-vitamin deficiency, chronic disease,..
-Diffuse osteoporosis
-Hyperparatiroidism
-Single asymptomatic bone lesion

Rajkumar SV. Lancet Oncology 2014

Recommended work up at 3 months in patients with MGUS/smouldering MM

- Medical History and physical examination
- Hemogram
- Creatinine and calcium values
- Protein studies

  - Total serum protein and serum electrophoresis (serum M-protein)
  - 24-h urine protein electrophoresis (urine M-protein)
  - Serum and urine immunofixation
  - Serum free light chain mesurement (FLC ratio)

If results show stabilization of the disease, diagnosis of MGUS/SMM is confirmed

Mateos MV et al. Current hematologic malignancy reports. 2013; 8(4): 270-6

MGUS: 3 subtypes

Tumor load

Aymptomatic; low-risk of progression	Asymptomatic; high-risk of progression	Symptomatic
Non-IgM MGUS	SMM	MM
IgM MGUS	SWM	WM
Light-chain MGUS	Idiopathic Bence Jones proteinuria	Light-chain MM

time

5.3% of population older than 70 yrs present a MGUS

Recommended work up at baseline in patients with MGUS

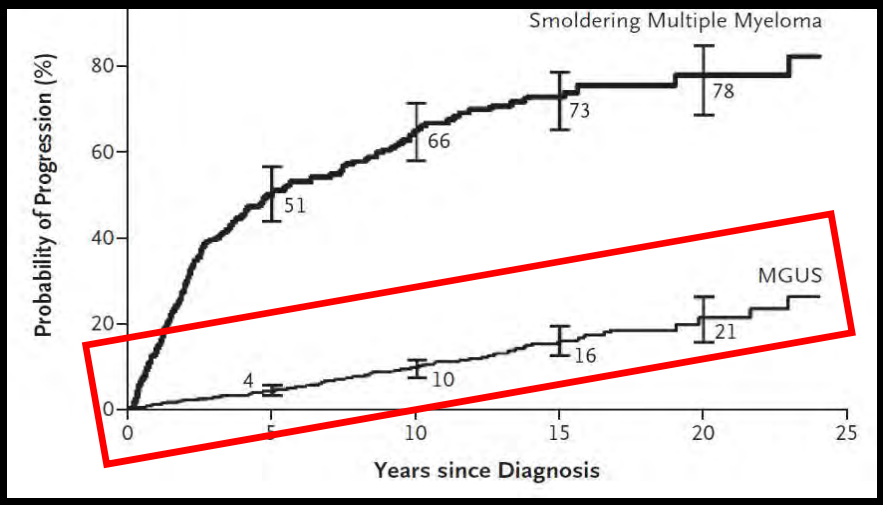
- **Medical History and physical examination**
- **Hemogram**
- **Creatinine and calcium values**
- **Protein studies**

  - Total serum protein and serum electrophoresis (serum M-protein)
  - 24-h urine protein electrophoresis (urine M-protein)
  - Serum and urine immunofixation
  - **Serum free light chain mesurement (FLC ratio)**

- **Bone Marrow aspirate+/- biopsy***
- **Bone lesions evaluation***

- For IgG MGUS with M-protein <1.5 g/dL, bone marrow and skeletal survey are not necessary
- For IgM MGUS, bone marrow and CT are recommended to detect MW or NHL

MGUS: Risk of progression to MM

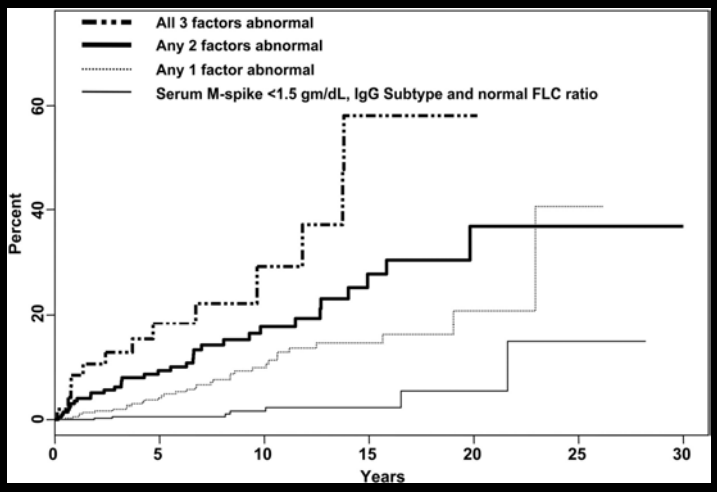


Is possible to evaluate the risk of progression?

Kyle NEJM 2007

1. Predictive factors: combinations

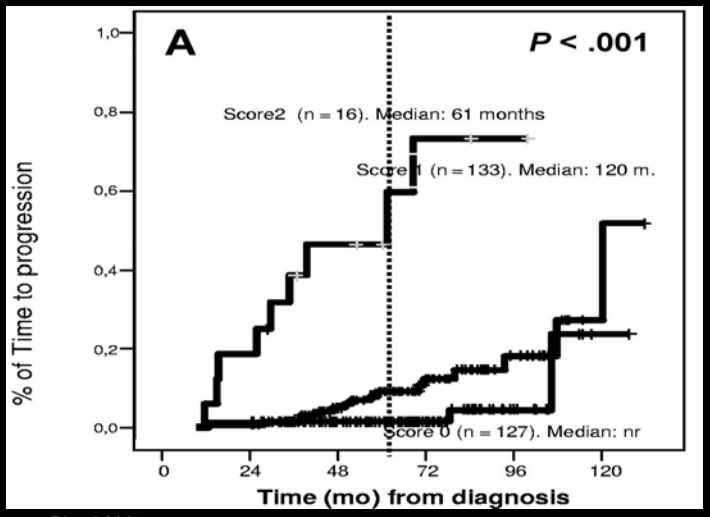
- non IgG MGUS
- M-protein ≥ 15 g/L
- Abnormal serum kappa/lambda FLC ratio



Rajkumar Blood 2005

2. Predictive factors: combinations

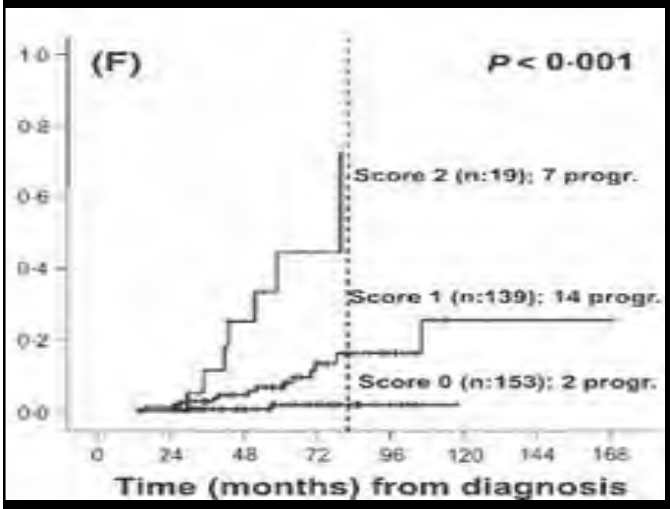
-DNA aneuploidy
-Multiparameter flow cytometry of bone marrow plasma cells
(≥95% aberrant BM plasma cells)



Pérez-Persona Blood 2007

3. Predictive factors: combinations

-Evolution of monoclonal component
-Multiparameter flow cytometry of bone marrow plasma cells
(≥95% aberrant BM plasma cells)



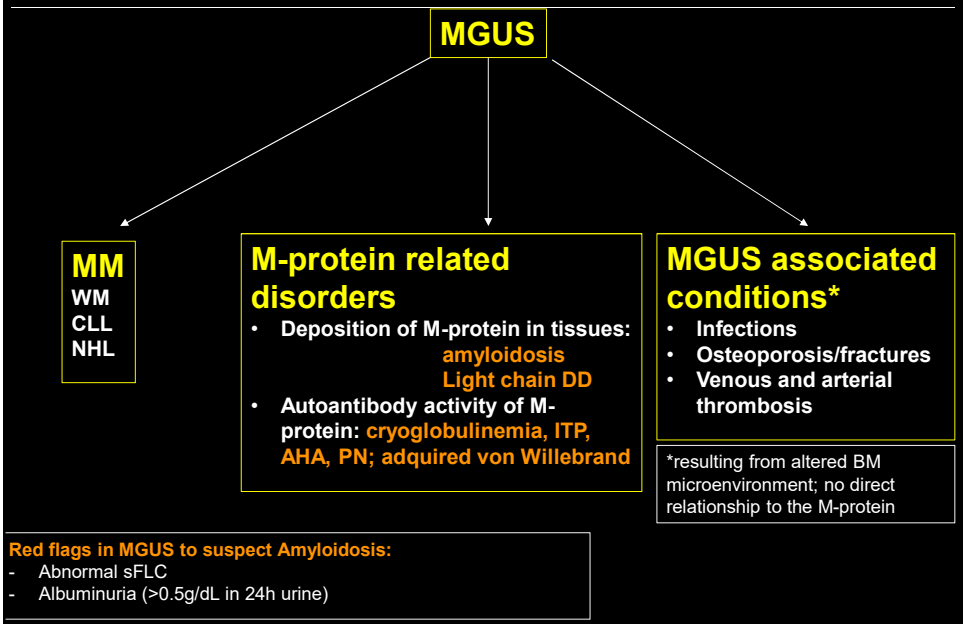
Pérez-Persona BJH 2010

MGUS: Management

- **Management should be risk-adapted**
- **Low risk MGUS (IgG/<1.5 g/dL/normal FLC): if stable 6 months after dx confirmation→ every 2 to 3 years**
- **Intermediate/high risk MGUS should be followed annually**

Kristinsson et al. reported significantly better OS in patients with MM who had prior knowledge of MGUS than in those without prior knowledge (median survival, 2.8 years versus 2.1 years, respectively; P = 0.01), suggesting that earlier treatment of MM leads to improved survival

MGUS: Special considerations



MGUS

- **MGUS is one of the most common premalignant disorders**
  - Malignant transformation
  - Symptoms related to the M-protein
  - Symtoms due to cytokines produced by plasma cell clone
  - Symtoms related to the plasma cell clone
- **Better biomarkers for predicting progression are needed**
- **Treatment of high-risk patients ?**

MGUS prevalence

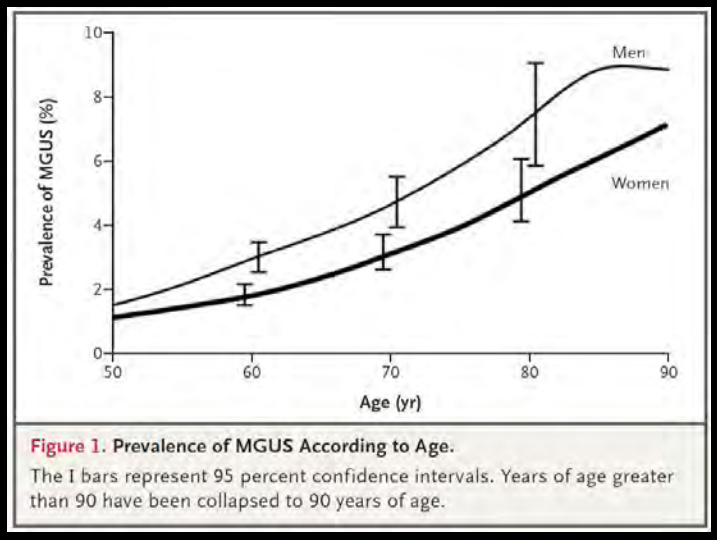


Figure 1. Prevalence of MGUS According to Age.
The I bars represent 95 percent confidence intervals. Years of age greater than 90 have been collapsed to 90 years of age.

Kyle NEJM 2006

Panel: **Revised International Myeloma Working Group diagnostic criteria for multiple myeloma and smouldering multiple myeloma**

Definition of multiple myeloma

Clonal bone marrow plasma cells ≥10% or biopsy-proven bony or extramedullary plasmacytoma* and any one or more of the following myeloma defining events:

- Myeloma defining events:
  - Evidence of end organ damage that can be attributed to the underlying plasma cell proliferative disorder, specifically:
    - Hypercalcaemia: serum calcium >0·25 mmol/L (>1 mg/dL) higher than the upper limit of normal or >2·75 mmol/L (>11 mg/dL)
    - Renal insufficiency: creatinine clearance <40 mL per min† or serum creatinine >177 μmol/L (>2 mg/dL)
    - Anaemia: haemoglobin value of >20 g/L below the lower limit of normal, or a haemoglobin value <100 g/L
    - Bone lesions: one or more osteolytic lesions on skeletal radiography, CT, or PET-CT‡
  - Any one or more of the following biomarkers of malignancy:
    - Clonal bone marrow plasma cell percentage* ≥60%
    - Involved:uninvolved serum free light chain ratio§ ≥100
    - >1 focal lesions on MRI studies¶

Subgroup of SMM patients that require be treated

Rajkumar et al. Lancet Oncology 2014; 15: e538-48

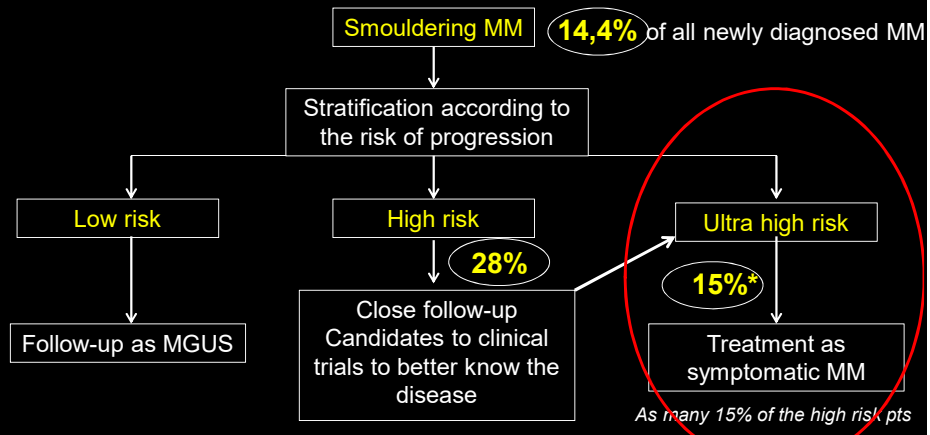
Smouldering Multiple Mieloma

What is the frequency of new MM according to the new definition?

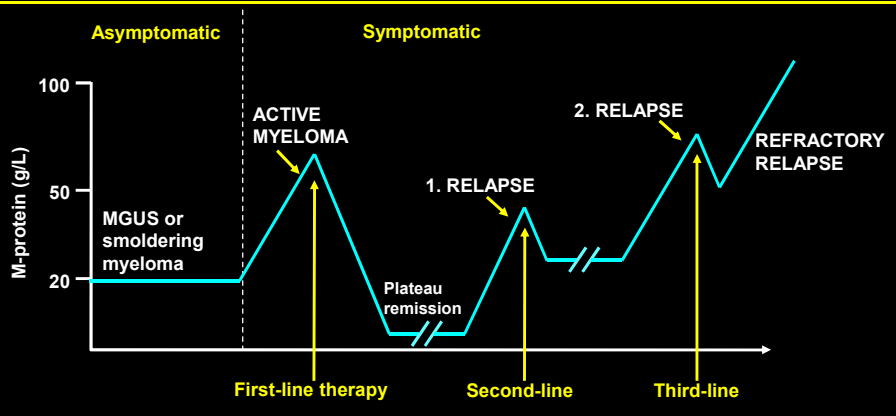


Using the World population as reference, the age standardized incidence of smouldering multiple myeloma is 0.44 per 100.000, and high-risk disease 0.14 per 100.000

Kristinsson S et al. NEJM 2013

What is the next step?
What happens with the other SMM patients?

Natural History of MM



Myeloma is always preceeded by MGUS or Smoldering Mieloma and is key to know the risk of progression to myeloma

MGUS, monoclonal gammopathy of undetermined significance

Why do we call it “smouldering”?

Monoclonal Gammopathy of uncertain significance (MGUS)

Smouldering Myeloma (SMM)

Multiple Myeloma (MM)

Transition from MGUS/SMM to MM

- Expansion of altered clones already present in MGUS patients

  López Corral et al. Leukemia 2012

- Branching model→ Key molecular events leading to disease evolution→ distinct patterns of driver mutations

  Walker et al. Nature Reviews Cancer 2012

- Differences in inmune surveillance

  Dosani et al. Blood Cancer J. 2015

MGUS, monoclonal gammopathy of undetermined significance

Objectives

- What is Smouldering Myeloma?
- Diagnosis of Smouldering Myeloma and differential diagnosis with other plasma cell disorders
- Why do we call it “Smouldering” Myeloma?
- What is the mechanism of transition from SMM to MM?
- What is the risk of progression to Myeloma?
- Is it possible to evaluate the individual risk of progression to Myeloma?
- Clinical cases

- What is the optimal management for Smouldering Myeloma patients?

- What is the risk of progression to Myeloma?
- Is it possible to evaluate the individual risk of progression to Myeloma?
- What is the optimal management for Smouldering Myeloma patients?

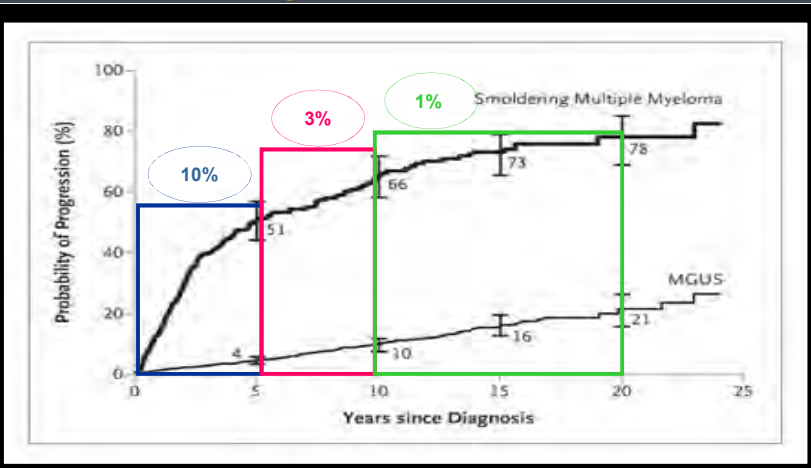
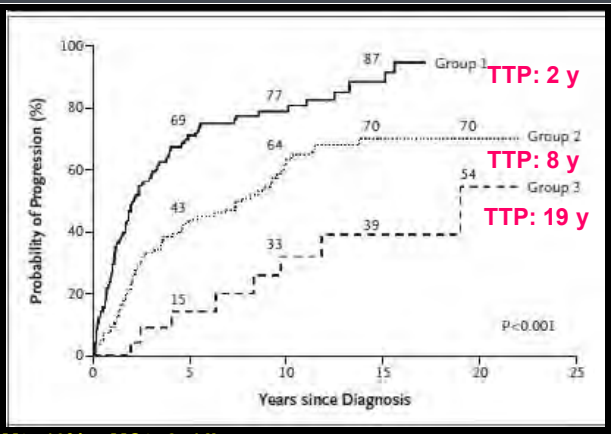
MGUS/Smouldering Multiple Myeloma: Risk of progression to active disease



According to the heterogeneity in the risk of progression to MM, we have to identify the individual risk for each new SMM patient.

Kyle R. N Engl J Med 2007; 356:2582-90

Mayo risk model: PCs BM infiltration and Serum M-component level



TTP: 2 y

TTP: 8 y

TTP: 19 y

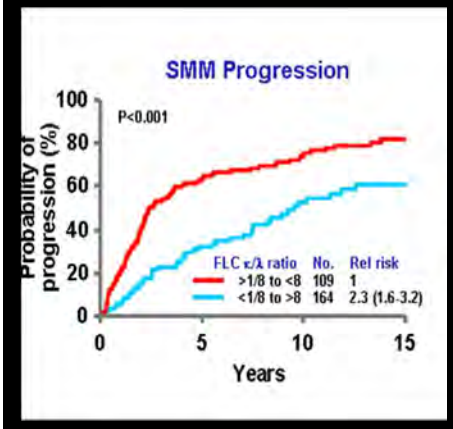
50% risk at 2 yrs

Group 1: *PCBM ≥ 10% + MC ≥ 3g/dl*
Group 2: *PCBM ≥ 10% + MC < 3g/dl*
Group 3: *PCBM < 10% + MC ≥ 3g/dl*

Kyle R. N Engl J Med 2007; 356:2582-90

Smouldering Multiple Myeloma: serum immunoglobulin free-light chain (FLC) ratio (n:273)

Serum FLC ratio <0.125 or > 8

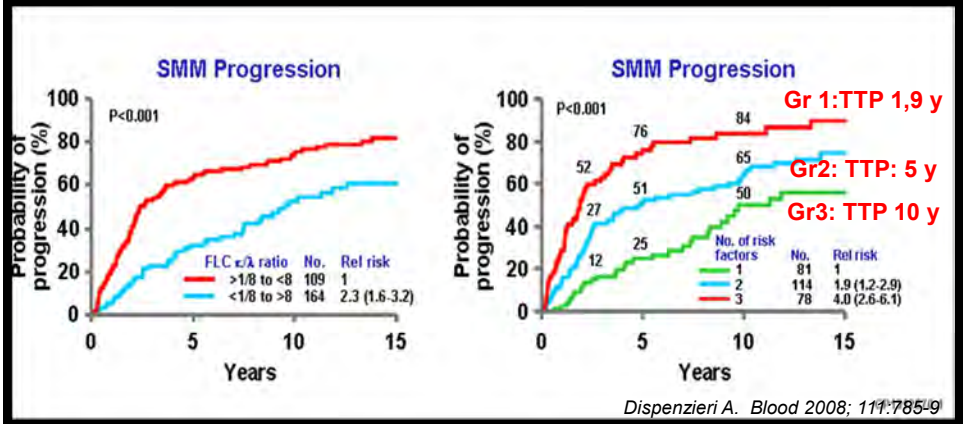


Dispenzieri A. Blood 2008; 111:785-9

Mayo Clinic model: serum immunoglobulin free-light chain (FLC) ratio (n:273)

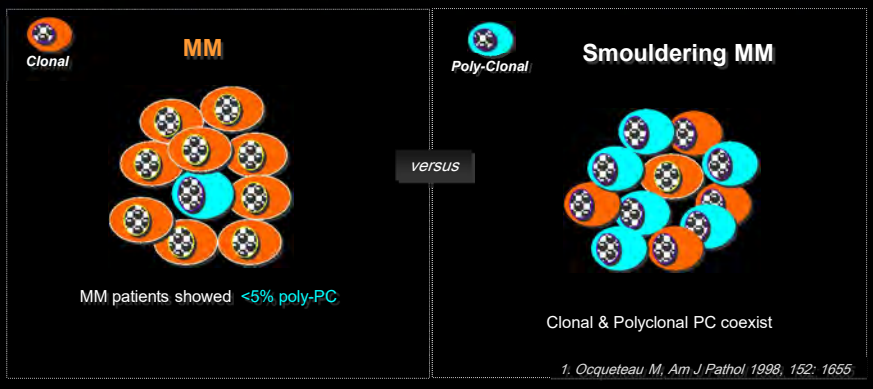
Serum FLC ratio <0.125 or > 8

PCsBM Infiltration ≥ 10%
Serum M protein ≥ 3 g/dL
Serum FLC ratio <1/8 or >8



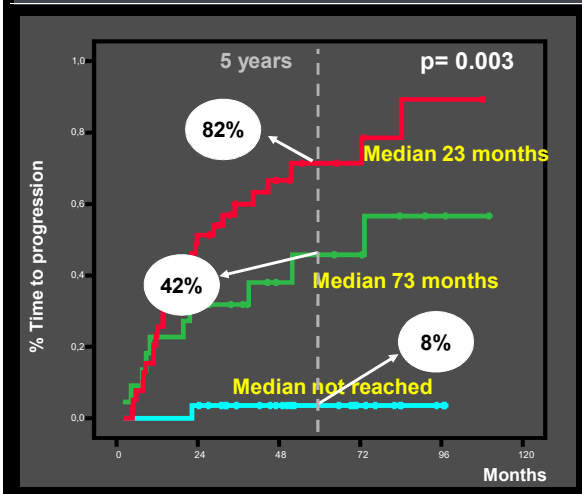
Dispenzieri A. Blood 2008; 111:785-9

Spanish Model: Analysis of the PC compartment by flow cytometry



Immunoparesis: Low levels of uninvolved immunoglobulins
>25% of the lowest level for each immunoglobulin

Spanish model: Aberrant PCs by immunophenotype plus immunoparesis



>95% aPC/BMPC + paresis
n= 39 (28 progr.)

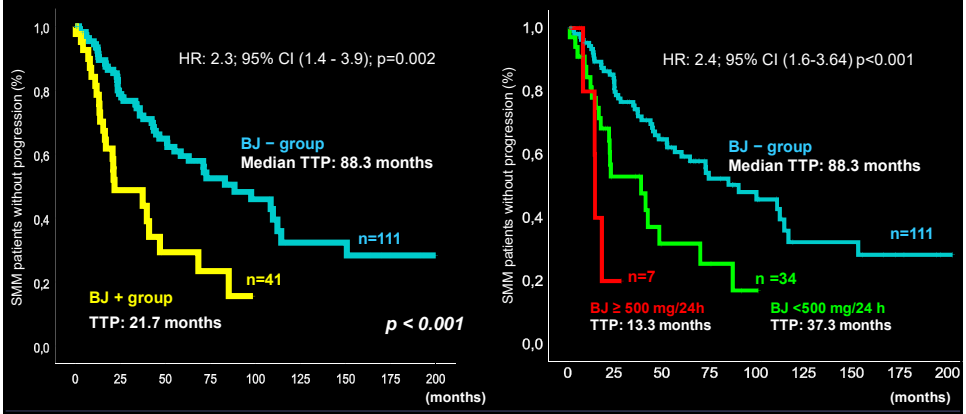
50% risk at 2 yrs

>95% aPC/BMPC or paresis
n= 22 (10 progr.)

No adverse factors
n= 28 (1 progr.)

Pérez E. Blood 2007; 110:2586-92

BJ proteinuria in SMM as a predictor marker of progression to symptomatic MM



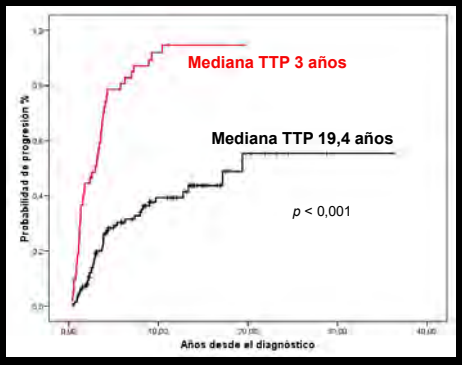
•Risk of progression at 2 years in BJ + group: 51%
•Risk of progression at 18 months in SMM BJ ≥ 500 mg/24 h : 80%

González- Calle V et al. Leukemia 2016

Evolution pattern of the M-spike: evolving vs nonevolving (n:207)

Evolving SMM (52 (25%)): **at least 10% increase within the first 6 months from diagnosis when M-Protein was ≥30 g/L or progressive increase in M-Protein in each of the annual consecutive measurements during a period of 3 years in patients with an initial MP < 30 g/L**

Non-evolving (75%): **Stable serum M-protein until progression occurs**



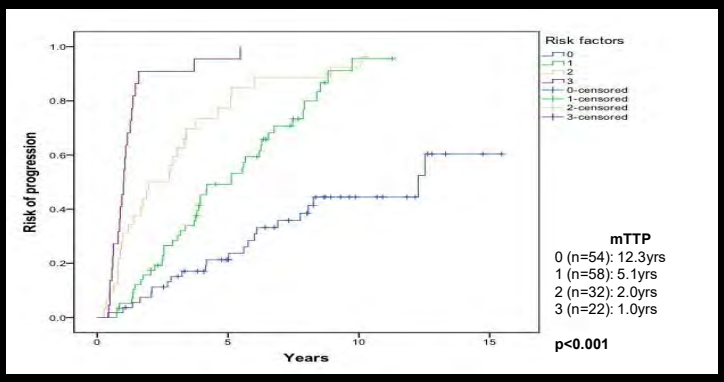
Evolving SMM

- Risk progression at 2 years: 45%
- Risk progression at 5 years: 78%
- IgA isotype: (41,2% frente a 23,8%, p=0,02)

Fernández Larrea C et al. ASH 2014

Evolution pattern of the M-spike + eHb + BMPC: (n:190)

Risk factors predicting high risk: 1) eMP as Larrea et al.; 2) eHb: decrease of ≥ 0.5g/dL Hb within 12m of diagnosis; and 3) BMPC infiltratation : ≥20%



SMM with eMP and eHb (with or without BMPC ≥20% had >80% risk of progression to MM within 2 years of diagnosis→ ultra high risk SMM

Ravi et al. ASCO 2016

Del(17p), t(4;14), and +1q21 predict progression from smouldering to symptomatic MM (n=248)

- del(17p13), t(4;14), +1q21 showed significant impact on TTP

	TTP	P
All pts	4.9 years	
+1q21 versus no gain of 1q21	3.7 years 5.3 years	0.013
del(17p13) versus no del(17p13)	2.7 versus 4.9 years	0.019
t(4;14) versus no t(4;14)	2.9 versus 5.2 years	0.021
HD versus NHD	3.9 versus 5.7 years	0.036

- Multivariate analysis: t(4;14), +1q21, HD, reduction of uninvolved immunoglobulins and risk score defined by Kyle et al. as independent factors for adverse outcome
- Conclusion: specific chromosomal aberrations drive transition from asymptomatic to symptomatic disease

Neben et al. JCO 2013; October 21 Epub ahead of print

Primary molecular cytogenetic abnormalities and risk of progression in SMM (n=351)

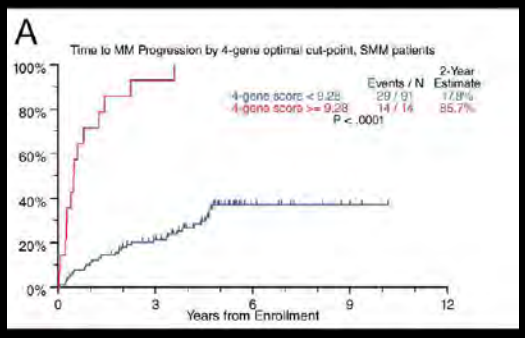
- del(17p13), t(4;14), trisomies showed significant impact on TTP

Cytogenetic abnormalities	TTP
High-risk subgroup	
t(4;14), del(17p)	24 months
Intermediate-risk subgroup	
Trisomy (ies) withouth IgH translocation	34 months
Standard/low-risk subgroup	
T(11;14), other, or no abnormalities	55 months/NR

Rajkumar SV. Leukemia 2013; 27(8): 1738-44

Gene Expression Profiling of purified CD138+ tumor cells in SMM (n: 105)

The validated 70-gene model (GEP-70) identified SMM patients with GEP70>-0.26 with a 51% of progression risk at 2 yrs.

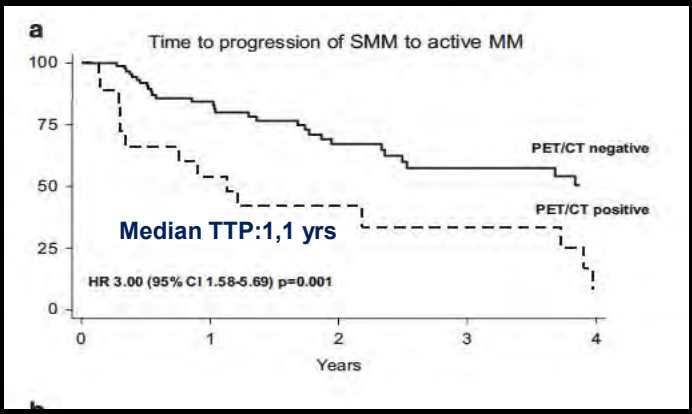


A gene signature derived from 4 genes at an optimal binary cut-point of 9.28, identified 14 patients (13%) with a 2-year therapy risk of 85.7%

Dhodapkar MV et al. Blood 2013
Khan RC et al. Haematologica 2015

PET-CT in SMM patients as predictor of progression to symptomatic MM (n: 120)

16% of patients had PET positive: 56% of them had 1 FL with a median PET SUV of 4.45 and no osteolysis was observed.

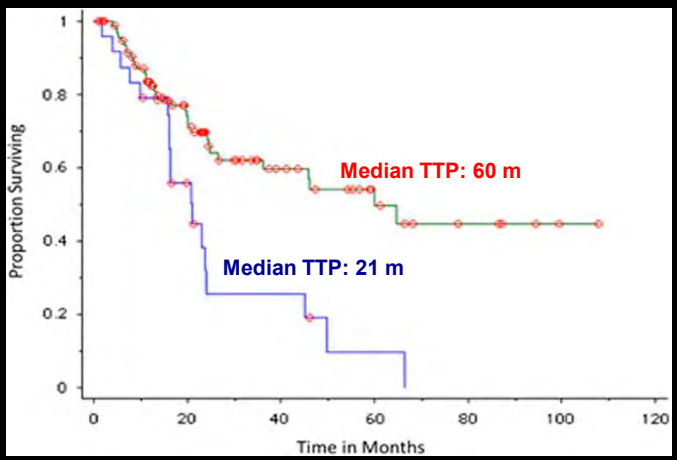


Relative risk of skeletal progression was 3.0 (95% CI 1.3-12, P= 0.013)

Zamagni E et al. Leukemia 2016

Smouldering Multiple Myeloma: PET/CT (n:188)

Positive PET/CT: 39% of the patients



Siontis B et al. Blood Cancer J 2016

Smouldering Multiple Myeloma: Risk models

Identification of high risk SMM→ 50% of progression risk at 2y

- ***Mayo Clinic:*** ≥10% clonal plasma cell bone marrow infiltration, and ≥30g/L of serum M-protein, and serum-free light ratio >0.125 or <8
- ***Spanish:*** ≥95% of aberrrant plasma cells measured by flow plus >25% decrease in one or both uninvolved immunoglogulins
- ***Heidelberg:*** Tumor mass defined by Mayo risk model plus t(4;14)/del17p/gains of 1q/
- ***Japanese:*** Beta 2-microglobulin ≥ 2.5 mg/L plus M-protein increment rate > 1 mg/dL/day
- ***SWOG:*** serum M-protein ≥2 g/dL plus involved free light chain >25 and GEP >-0.26 (71% of risk progression at 2 yrs)
- ***PENN:*** **≥ 40% clonal PCBM infiltration plus sFLC ratio ≥ 50 plus Albumin □ 3.5 mg/dL (81% of risk at 2 yrs)**
- ***Czech & Heidelberg:*** immunoparesis plus serum M-protein ≥ 2.3 g/dL plus involved/uninvolved sFLC > 30 **(81% of risk at 2 yrs)**
- ***Barcelona:*** evolving pattern plus serum M-protein ≥ 3 g/dL plus immunoparesis **(80% of risk at 2 yrs)**

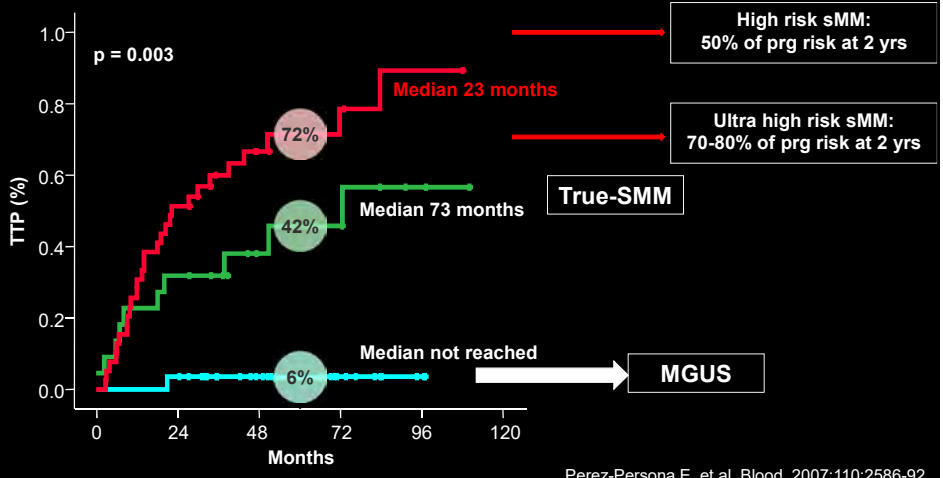
Each model appears to identify patients at high risk, with some but not complete overlap

Smouldering Multiple Myeloma: Risk models

Identification of high risk SMM→ 50% of progression risk at 2y

- ***Mayo Clinic:*** ≥10% clonal plasma cell bone marrow infiltration, and ≥30g/L of serum M-protein, and serum-free light ratio >0.125 or <8
- ***Spanish:*** ≥95% of aberrrant plasma cells measured by flow plus >25% decrease in one or both uninvolved immunoglogulins
- ***Heidelberg:*** Tumor mass defined by Mayo risk model plus t(4;14)/del17p/gains of 1q/
- ***Japanese:*** Beta 2-microglobulin ≥ 2.5 mg/L plus M-protein increment rate > 1 mg/dL/day
- ***SWOG:*** serum M-protein ≥2 g/dL plus involved free light chain >25 and GEP >-0.26 (71% of risk progression at 2 yrs)
- ***PENN:*** **≥ 40% clonal PCBM infiltration plus sFLC ratio ≥ 50 plus Albumin □ 3.5 mg/dL (81% of risk at 2 yrs)**
- ***Czech & Heidelberg:*** immunoparesis plus serum M-protein ≥ 2.3 g/dL plus involved/uninvolved sFLC > 30 **(81% of risk at 2 yrs)**
- ***Barcelona:*** evolving pattern plus serum M-protein ≥ 3 g/dL plus immunoparesis **(80% of risk at 2 yrs)**

Smouldering MM: Heterogeneous disease



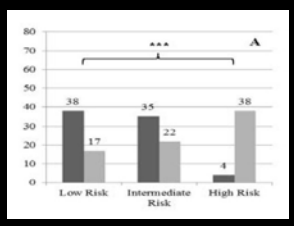
Perez-Persona E, et al. Blood. 2007;110:2586-92.

Disagreement between smoldering myeloma risk models

Distribution of 77 SMM patients using both the Mayo and Spanish models. Overall agreement 22/77 (28.6%)

	PETHEMA low, n	PETHEMA mid, n	PETHEMA high, n
Mayo low, n	11	15	12
Mayo mid, n	6	7	22
Mayo high, n	0	0	4

Significant disagreement between models (p<0.0001)

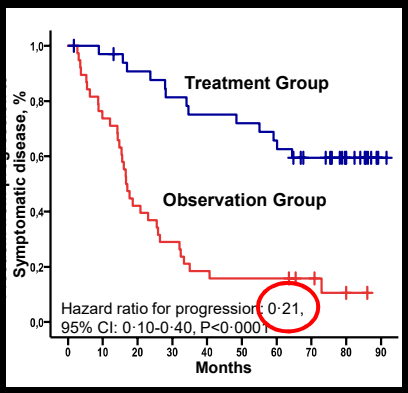


Cherry et al. *Leuk Lymphoma 2013*

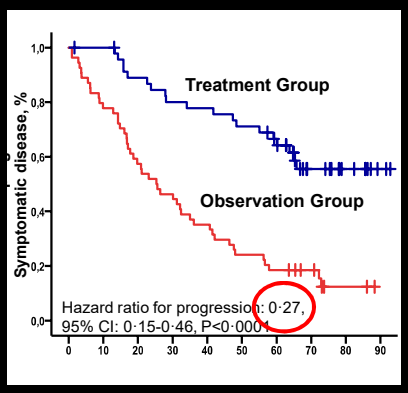
Concordance between Mayo and Spanish model

Len-dex vs no treatment: TTP to active disease (n = 119)

Mayo Risk model



Spanish Risk model



Mateos MV et al. Data unpublished

What is the next step?
What happens for the other SMM patients?

How to proceed once patients are stratified according to the risk?

Smouldering Multiple Myeloma: Management

- Management should be risk-adapted
- Low risk SMM should be followed as MGUS-like pts: annually
- Intermediate risk SMM should be followed as true SMM pts: every 6 months
- Ultra high-risk should be considered MM and be treated
- High-risk SMM can benefit from early treatment

Low and Intermediate risk Smouldering Multiple Myeloma

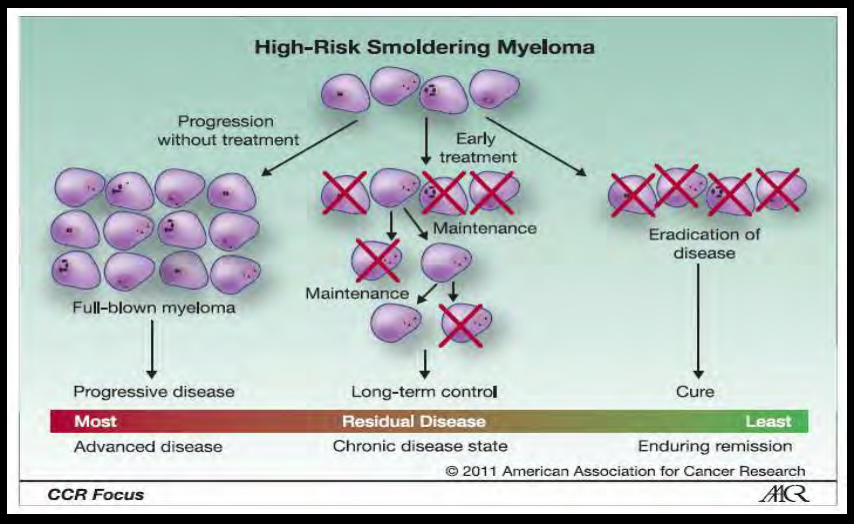
What is the optimal work-up to do?

- Medical History and physical examination
- Hemogram
- Creatinine and calcium values
- Protein studies
  - Total serum protein and serum electrophoresis (serum M-protein)
  - 24-h urine protein electrophoresis (urine M-protein)
  - Serum and urine immunofixation
  - Serum free light chain mesurement (FLC ratio)
- Bone Marrow aspirate+/- biopsy Only if suspect of active disease
- Skeletal survey/Low-dose CT/PET-CT PET-CT annually for intermediate risk?
- MRI of the spine and pelvis/ Whole-body MRI Repeat at 6 months if one focal lession was present.

Smouldering Multiple Myeloma: Management

- Management should be risk-adapted
- **Low risk SMM** should be followed as MGUS-like pts: annually
- **Intermediate risk SMM** should be followed as true SMM pts: every 6 months
- **Ultra high-risk** should be considered **MM** and be treated: new biomarkers will be in the future incorporated to the MM definition
- **High-risk** SMM can benefit from early treatment

Treatment goals for high-risk smouldering myeloma



Landgren et al, *Clin Cancer Research 2011*

Smouldering Multiple Myeloma: Management

Agents	ORR (%)	TTP	OS	Reference
Early MP* vs Deferred MP	52 55	No benefit	No benefit	Hjorth M, et al. Eur J Haematol. 1993 Grignani G, et al. Br J Cancer. 1996 Riccardi A, et al. Br J Cancer. 2000
Thal+Zol vs Zol**	37 0	No benefit	No benefit	Witzig TE, et al. Leukemia 2013
Bisphosphonates***vs observation	0	No benefit	No benefit	Martin A, et al. Br J Haematol. 2002 D'arena et al. Leuk Lymphoma. 2011 Musto P, et al. Cancer. 2008

**Abandon: No differences in survival and potential risk of secondary leukemias*
***Low efficacy&high rates of discontinuation due to PN*
****Skeletal related events lower in the bisphosphonate groups* ***(39% vs 73% and 55% vs 78%)***

Smouldering Multiple Myeloma: Management

Agents	ORR (%)	TTP	OS	Reference
Early MP* vs Deferred MP	52 55	No benefit	No benefit	Hjorth M, et al. Eur J Haematol. 1993 Grignani G, et al. Br J Cancer. 1996 Riccardi A, et al. Br J Cancer. 2000

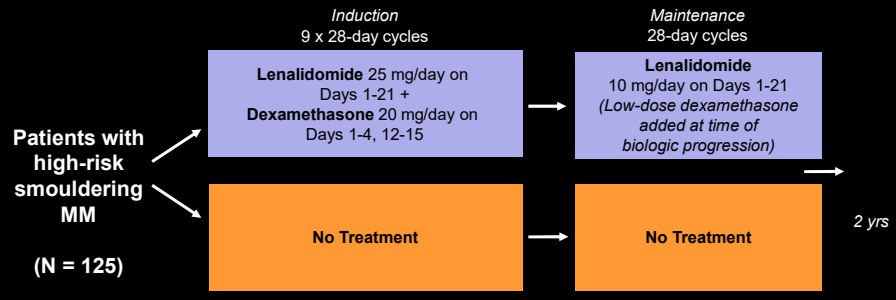
Low, intermediate and high risk patients were included

**Abandon: No differences in survival and potential risk of secondary leukemias*
***Low efficacy&high rates of discontinuation due to PN*
****Skeletal related events lower in the bisphosphonate groups* ***(39% vs 73% and 55% vs 78%)***

QuiRedex: Study Design

- Multicenter, open-label, randomized phase III trial



In both arms, blood counts, biochemical analysis (including creatinine and calcium) and serum/urine levels of MC were performed monthly. Skeletal survey was performed during the screening phase and thereafter only if clinical symptoms emerged.

High-risk was defined according to the Mayo and/or Spanish models

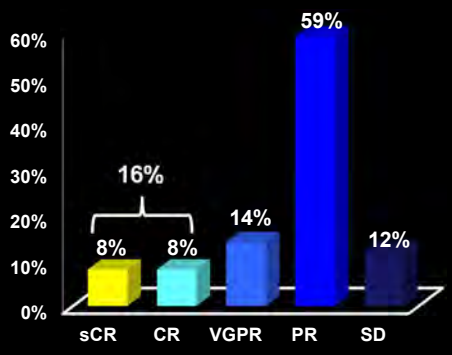
Mateos MV, et al. NEJM 2013; 369:438-47

Lenalidomide + Dex: response rate

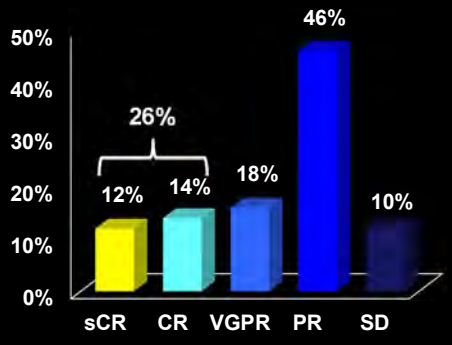
On ITT (n = 57) Median number of induction cycles: 9 (range 1–9)

***ORR: 80%; sCR: 7%, CR: 7%; VGPR: 11%; PR: 65%;* SD: 21%**

After 9 induction cycles (n = 51)



After a median of 15 maintenance cycles (2-41) (n=50)



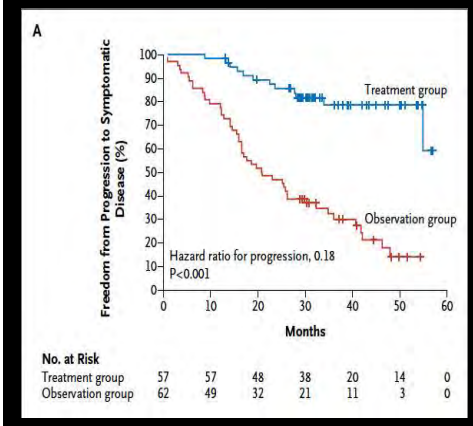
*IMWG criteria.

Mateos MV, et al. NEJM 2013; 369:438-47

Len-dex vs no treatment: TTP to active disease (n = 119)

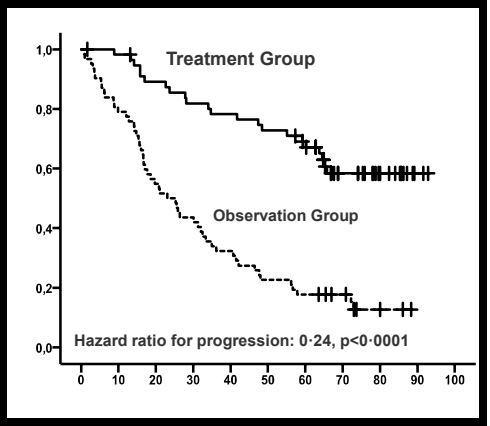
Per-protocol Patients population

Median follow-up: 40 m



Mateos MV, et al. NEJM 2013

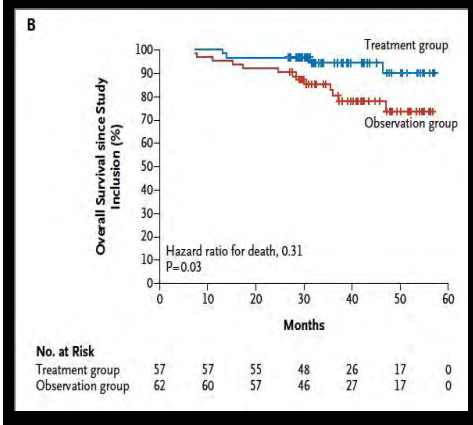
Median follow-up: 75 m



Mateos MV, et al. Lancet Oncology 2016: accepted for publication

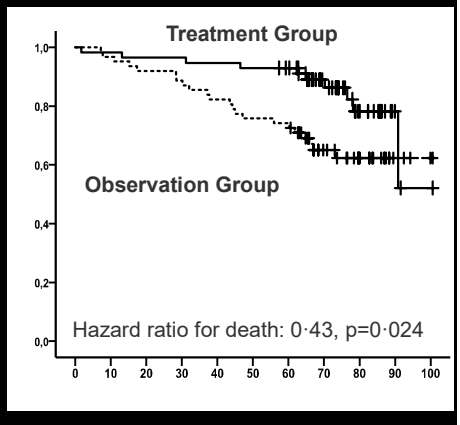
Len-dex vs no treatment: OS from inclusion (n = 119)

Median follow-up: 40 m



Mateos MV, et al. NEJM 2013

Median follow-up: 75 m



Mateos MV, et al. Lancet Oncology 2016: accepted for publication

Len-dex: biological progressions (n:57 pts)

15 biological progressions during maintenance therapy

Dex was added according to the protocol

(20 mg 4 days)

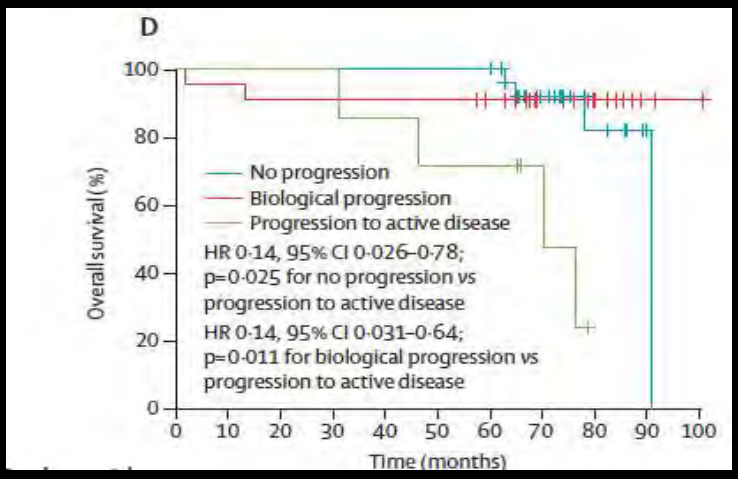
- **3 pts achieved PR and 12 stabilized their disease**
  - **5 finally progressed to Myeloma**
  - **10 pts remain in stable disease and five of them with len 10 mg plus 20 mg dex for 4 days**

Why this pre-emptive strategy only for the experimental arm?
What was the benefit of this pre-emptive strategy?

Mateos MV, et al. Lancet Oncology 2016: accepted for publication

Len-dex vs no treatment: OS according to the type of progression (n = 119)

Median follow-up: 75 m



Mateos MV, et al. Lancet Oncology 2016: accepted for publication

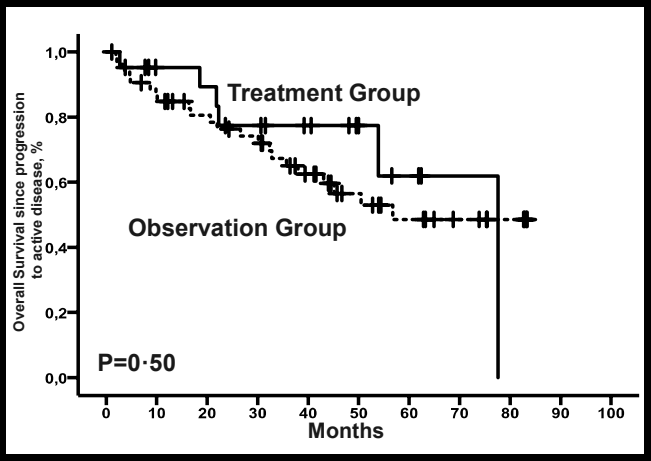
What about rescue therapies?

Subsequent therapy	Lenalidomide-dex (n=22)	Observation (n=53)
PI-based combinations	13 (59%)	23 (43%)
IMiD's-based combinations	3 (14%)	8 (15%)
PI-IMiD's-based combinations	2 (9%)	16(30%)
Conventional chemotherapy	4 (18%)	6 (11%)
	4 pts (18%) received ASCT	15 pts (28%) received ASCT

Mateos MV, et al. Lancet Oncology 2016: accepted for publication

Len-dex vs no treatment: OS from progression to active disease (n = 119)

Median follow-up: 75 months



Early treatment does not induce more resistant relapses

Mateos MV, The Lancet Oncology 2016: accepted for publication

QuiRedex: toxicity profile during induction (n:125)

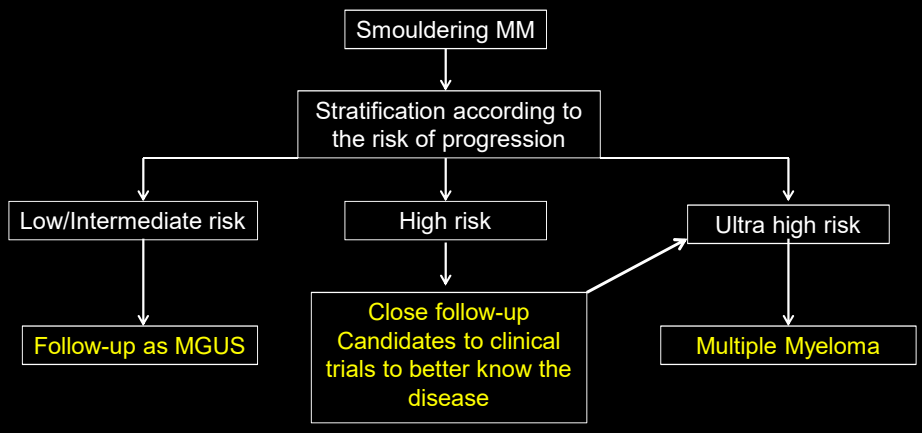
	Len-dex arm (n:62)		Abstention arm (n:63)
	G1	G2	G1-2
Anemia	11 (20%)	4 (7%)	2 (4%)
Neutropenia	3 (6%)	8 (14%)	
Thrombopenia	6 (11%)	1 (2%)	
Asthenia	6 (11%)	5 (9%)	6 (11%)
Constipation	4 (7%)	6 (11%)	1 (2%)
Diarrhea	9 (17%)	4 (7%)	2 (4%)
Rash	12 (23%)	6 (11%)	
Infection*	19 (35%)	6 (11%)	14 (26%)
DVT**	1 (2%)	2 (4%)	
SPM -Hematologic -Non hematolog	1 patient (PV) 5 patients*		1 patient (MDS)

*3 prostate cancers, 1 breast cancer and 1 cervical epidermoid carcinoma

The cumulative risk of developing a second primary malignancy at 7 years was 12% (95% CI 0á31–11) in the treatment group and 3% (0–4) in the observation group (p=0.070).

Mateos MV, et al. Lancet Oncology 2016: accepted for publication

Smouldering Multiple Myeloma



- **Though there is not any drug approved for SMM, it is dificult and "almost unethical" not offering treatment NOW to high risk SMM**
- **What is the most appropriate treatment?**

High-risk Smouldering Multiple Myeloma

- Len-dex is effective as early treatment, with benefit in TTP to active disease and also in OS
- Numerous clinical trials with several drugs are currently ongoing in this group of patients:
  Elotuzumab, daratumumab, Elo-Rd, KRd, ….

Current Studies in High-Risk Smouldering MM

- Biomarker study of elotuzumab (phase II)[2]
- Siltuximab (anti IL6) or no treatment (phase II)[3]
- Biomarker study of BHQ880 (anti DKK1) (phase II)[4]: *Data presented at ASH2012: no antitumor effect but anabolic activity*
- Lenalidomide or observation (phase III)[1]
- Elotuzumab-Lenalidomide-dex
- Daratumumab single agent at different doses (Centaurus trial)
- Carfilzomib, lenalidomide, and dexamethasone (phase II)[5]:

1. ClinicalTrials.gov. NCT01169337.
2. ClinicalTrials.gov. NCT01441973.
3. ClinicalTrials.gov. NCT01484275.
4. ClinicalTrials.gov. NCT01302886.
5. ClinicalTrials.gov. NCT01572480.

Phase II trial for high-risk SMM: Carfilzomib/Revlimid/dex

Study open for high-risk smouldering myeloma pts ≥18 years old

8 cycles KRd Combination Therapy

Carfilzomib 20/36 mg/m²,
day 1, 2, 8, 9, 15, 16

Lenalidomide 25 mg/day,
day 1-21

Dexamethasone 20/10 mg
day 1, 2, 8, 9, 15, 16, 22, 23

SD or better?

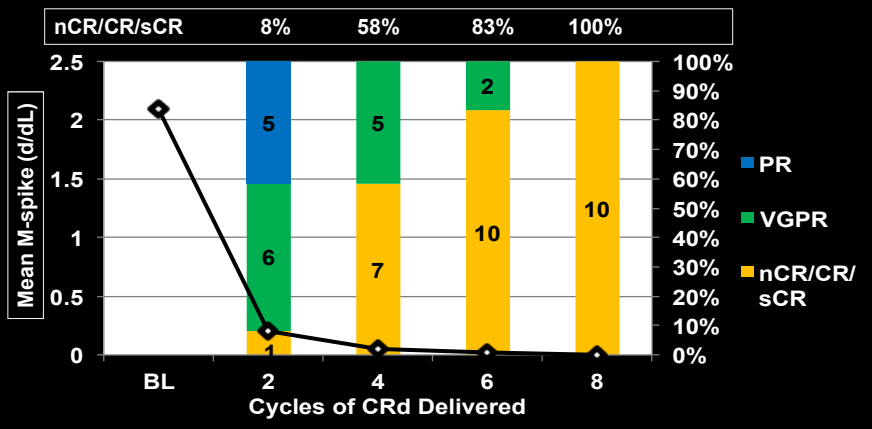
24 cycles Rev Extended Dosing

Lenalidomide 10 mg/day, day 1-21

- Each cycle is 28 days
- Stem cell harvest after ≥4 cycles of CRd for patients <70-75 yrs
- C1D1/2 – Carfilzomib dose is 20 mg/m²
- C1- 4 – Dex dose is 20 mg, C5- 8 – Dex dose is 10 mg

Landgren, et al. *ASH2014: abstract 4746*

Response rates in relation to cycles of KRd



11/12 (92%) are MRD negative by 8-color flow cytometry of the bone marrow

Landgren, et al. *ASH2014: abstract 4746*

Curative Estrategia Smouldering Alto Riesgo (CESAR trial) (n:90)

Induction 6 cycles of KRd

MRD

ASCT (melphalan 200)

MRD

Consolidation (2 cycles of KRd)

MRD

Maintenance (Len-dex for 2yrs)

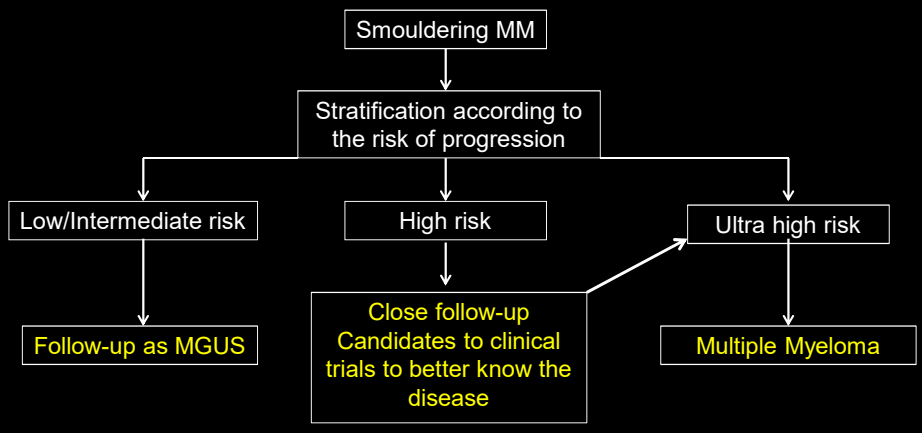
MRD

Primary objective: To evaluate the proportion of patients in sustained immunophenotypic response at 5 years

Hypothesis: At least 50% of patients will achieve the objective

20 centers

Smouldering Multiple Myeloma



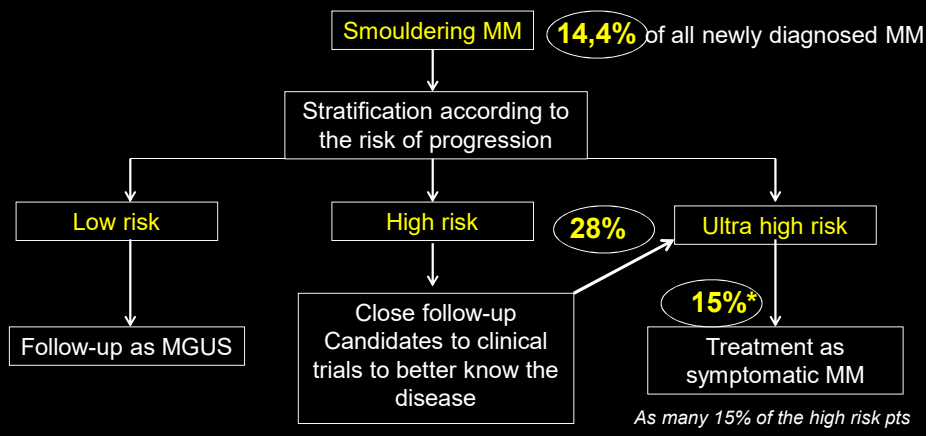
- **In the near future, new biomarkers will be validated and more SMM patients will be considered as Myeloma and patients will be treated as patients with active disease**

Smouldering Multiple Myeloma: Summary

- **The standard of care remains observation until progression to active disease**
- **The results of the studies would support to plan early treatment in patients at high risk of progression to MM**
- **Len-dex is effective as early treatment, with benefit in TTP to active disease and also in OS**
- **Numerous clinical trials with several drugs are currently ongoing in this group of patients**

These results support to change the current treatment paradigm for this patient population
Early treatment for high risk SMM patients

Smouldering Multiple Myeloma



Using the World population as reference, the age standardized incidence of smouldering multiple myeloma is 0.44 per 100.000, and high-risk disease 0.14 per 100.000

Kristinsson S et al. NEJM 2013

How I treat newly diagnosed transplant eligible patients with multiple myeloma

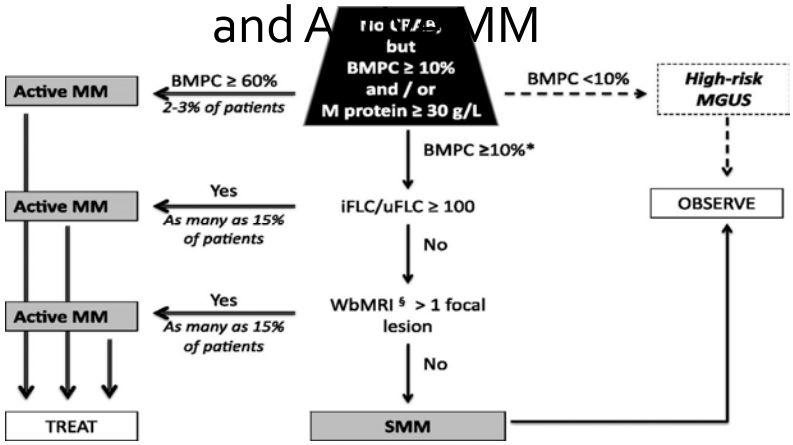
Sergio Giralt MD
Melvin Berlin Family Chair in Myeloma Research
Professor of Medicine, Weill Cornell Medical College
Chief Attending, Adult BMT Service
Memorial Sloan Kettering Cancer Center

Start with the basics

Case Presentation: MJ

- MJ is a 50 year old female who on routine PE was found with a total elevated serum protein 10.5 gm/lt and a hemoglobin of 11 gm/dl.
- Further work up reveals
- SPEP shows IgG 4,700 mg/dL and kappa 5,200 mg/dL
- M spike 4.2 g/dL
- 24-hour urine was normal < 0.16 g/24 hours
- β_2-microglobulin normal 1.6 mg/L
- Bone marrow biopsy showed 60% plasma cells; normal cytogenetics, no IgH translocations. DECREASED IRON STAINS
- Bone survey showed mild osteopenia

Algorithm for Reclassifying SMM and A[illegible]MM



- *Consider including patients with the following FISH: deletion 17p, t(4;14), and 1q21 gains as active MM; this population could account for as many as 30% of SMM patients. §Consider using more than 1 fluorodeox.

Study Design

Eligibility/Treatment

- NDMM
- Transplant eligible and non-eligible
- Treatment duration: ≤13 cycles or until elective discontinuation for ASCT
- No clinically significant cardiac disease; echo required at screening

Dosing Schedule (28-d cycles)

Daratumumab:

- Split dose: 8 mg/kg Days 1-2 of Cycle 1
- 16 mg/kg QW on Cycles 1-2, Q2W on Cycles 3-6, and Q4W thereafter

Carfilzomib:

- 20 mg/m^2 C1D1
- Escalated to 70 mg/m^2 C1D8+; weekly (Days 1, 8, 15)

Lenalidomide:

- 25 mg; Days 1-21 of each cycle

Dexamethasone: 40 mg/week[a]

Endpoints

Primary

- Safety, tolerability

Secondary

- ORR, duration of response, time to response, IRR

Exploratory

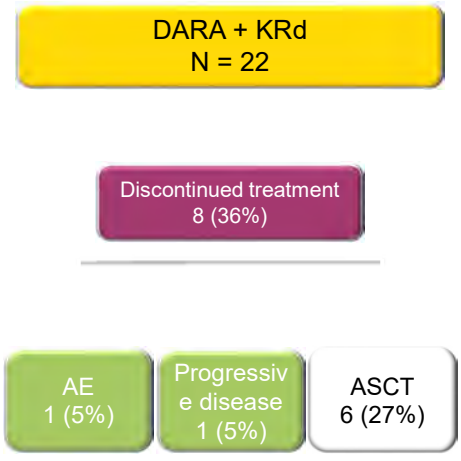
- PFS

Baseline Demographics

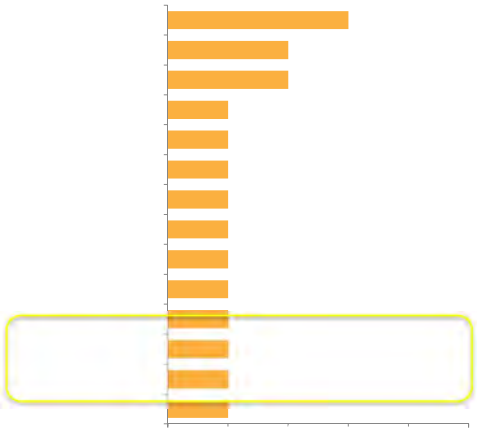
Characteristic	DARA + KRd (N = 22)
Age, years, n (%)	
Median (range)	59.5 (34-74)
<65	15 (68)
65 - <75	7 (32)
Gender, n (%)	
Male	12 (55)
Female	10 (46)
Race, n (%)	
White	19 (86)
African American	1 (5)
American Indian or Alaska Native	1 (5)
Not reported	1 (5)
ECOG score, n (%)	
0	12 (55)
1	9 (41)
2	1 (5)

Patient Disposition

- Median follow-up:
  10.8 (range, 4.0-12.5) months
- Median number of treatment cycles:
  11.5 (range, 1.0-13.0)
- Except for 3 patients, all escalated to carfilzomib 70 mg/m^2 by C2D1
  - 1 discontinued treatment before C2D1
  - 1 dose reduction to 56 mg/m^2 at C2D1
  - 1 escalated to 70 mg/m^2 at C3D8



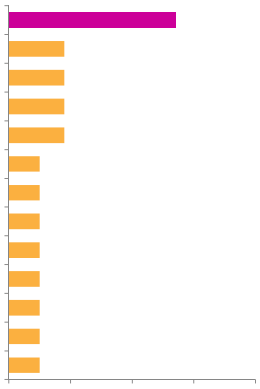
Serious TEAEs (N = 22)



Consistent with previous reports from KRd studies

Infusion Times and Reactions (N = 22)

Infusion Times	
Infusion	**Median (range) infusion time, h**
First	
C1D1	**4.15 (4.0-6.0)**
C1D2	**4.15 (3.9-6.0)**
Second	**4.18 (3.6-7.1)**
Subsequent	**3.38 (1.4-6.1)**

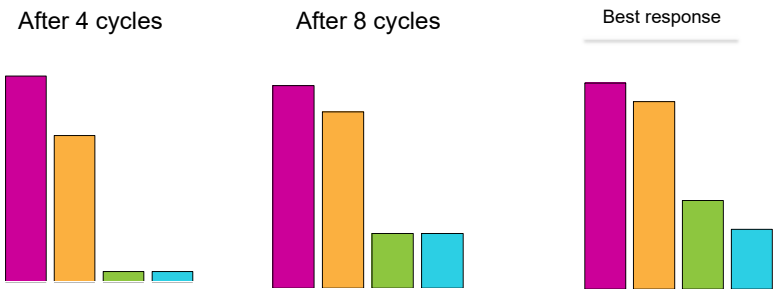


- No grade 3/4
- Occurrence
  - First infusion: 5 (23%) patients
  - Second infusion: 1 (5%) patient
  - Subsequent infusions: 1 (5%) patient

Lower rates of IRRs observed with split first dosing

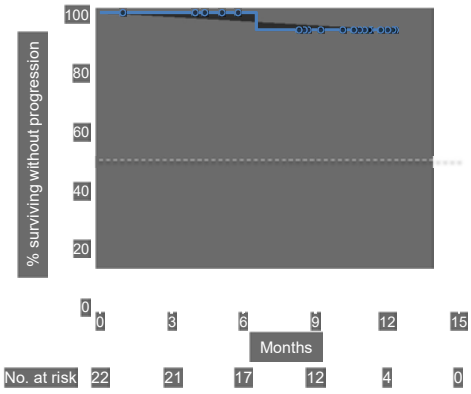
Response Rate[a,b]

- Median number of treatment cycles: 11.5 (range, 1.0-13.0



Depth of response improved with duration of treatment

PFS



- Median follow-up: 10.8 (range, 4.0-12.5) months
- Overall survival = 100

12-month PFS rate[a] = 94%

Stem Cell Harvest and ASCT[a]

- Median number of $CD34^+$ cells collected from patients: 10.4 x 10^6 cells/kg (n = 19)
- Median 5 treatment cycles prior to stem cell harvest

Patient	Stem cell mobilization	Total $CD34^+$ cells ($x10^6$/kg body weight)	Treatment cycle at ASCT	Best response[b]
1	Plerixafor and Filgrastim	30	9	sCR
2	Plerixafor and Filgrastim	12	5	VGPR
3	Plerixafor and Filgrastim	28	4	VGPR
4	Filgrastim	38	4	VGPR
5	Plerixafor and	10.4	5	VGPR
6	Filgrastim	6.5	4	VGPR

Stem cell yield is consistent with previous KRd studies

[a]Per protocol, patients who continued to ASCT discontinued study treatment.
[b]Best response among patients who elected ASCT.

Auto/RVD	254	195	160	91
Auto/Maint	257	212	157	79

331

Conclusion

- In the era of thalidomide analogues and proteasome inhibitors used in the initial therapy for myeloma (in this study >90% either, >50% both) and the use of prolonged maintenance therapy with lenalidomide, post transplant consolidation with cycles of RVD or a second transplant do not produce incremental PFS benefit.

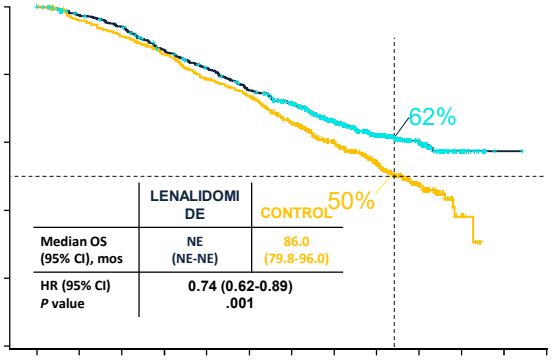
Lenalidomide Maintenance After High-Dose Melphalan and Autologous Stem Cell Transplant in Multiple Myeloma: A Meta-Analysis of Overall Survival

Michel Attal,[1] Antonio Palumbo,[2] Sarah A. Holstein,[3] Valérie Lauwers-Cances,[1] Maria Teresa Petrucci,[4] Paul Richardson,[5] Cyrille Hulin,[6] Patrizia Tosi,[7] Kenneth C. Anderson,[5] Denis Caillot,[8] Valeria Magarotto,[9] Philippe Moreau,[10] Gerald Marit,[11] Zhinuan Yu,[12] Philip L. McCarthy[13]

Overall Survival: Median Follow-Up of 80 Months



All SPMs After Randomization

SPMs, n[b]	CALGB[a]		IFM		GIMEMA	
	LEN (n = 224)	Placebo (n = 221)	LEN (n = 306)	Placebo (n = 302)	LEN (n = 56)	No MNTC (n = 79)[c]
Hematologic	15	8	21	9	0	0
AML[d]	7	0	6	3	–	–
MDS	4	4	4	3	–	–
B-cell malignancy	4	3	11	2	–	–
Other	0	1	1	1	–	–
Solid tumors	17	10	21	13	5	2

[a]SPMs in placebo arm include those that occurred after crossover. [b]Patients who experienced > 1 SPM (eg, 2 types of SPMs) or > 1 episode of an SPM are counted once in each SPM category. This analysis includes SPMs before and after PD. [c]In the GIMEMA-RV-MM-PI-209 study, the no maintenance arm includes patients eligible for the maintenance phase without any dose of LEN maintenance. [d]Includes AML and MDS to AML.

AML, acute myeloid leukemia; LEN, lenalidomide; MDS, myelodysplastic syndromes; MNTC, maintenance; SPMs, second primary malignancy.

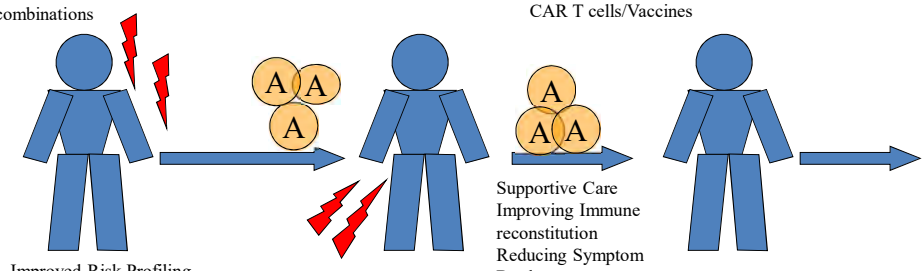
Future Directions in Myeloma and HCT

Pre HCT Therapy
Improved induction
Carfilzomib/Daratumumab combinations

Graft Engineering to Enhance Immune Recovery

Post Transplant Cellular & Immune Therapies

CAR T cells/Vaccines



Improved Risk Profiling
Response and Risk Adapted Therapy

Prep Regimen
Novel combinations
Melflufen
Radio-immune-conjugates

Supportive Care
Improving Immune reconstitution
Reducing Symptom Burden

Relapse Prevention
Drugs
Antibodies
ImIDS
PIs
Cells/Vaccines
WT1
Car T cells
Myeloma DC vaccine

Frontline Treatment for MM Transplant Eligible

- Current standard is
  - Triple induction (ImID,PI, steroids)
  - Single high dose melphalan auto HCT
  - Maintenance lenalidomide
- HCT severely underutilized in United States
- Risk Stratification is still NOT STANDARD
- However…
  - Patients with high risk features reasonable to explore
    - IMID/PI maintenance
  - Tandem auto or auto/allo HCT
- MRD Directed therapy not yet standard but all roads point towards that destination

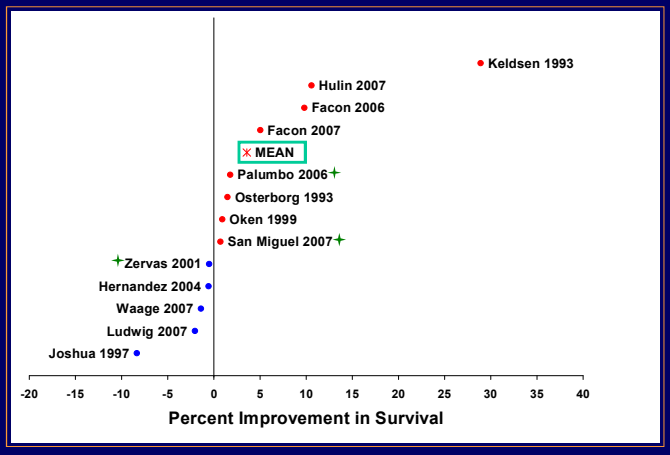
The Older Fit Patient

Therapeutic Considerations:

Is CR/MRD the goal?

CR in non-transplant setting

van de Velde et al. Haematologica 2007



Mean = 3.6%		
ΔCR/nCR	OS	ΔOS
+10%	35m	+12.6m
+10%	50m	+18m

Median not available, OS calculated from 2yr (San Miguel), 3yr (Palumbo) and 5yr (Zervas) esti

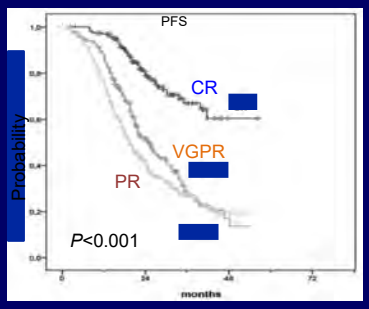
- Medline/OVID search from 1980 – Mar 2008
- 13 studies (4396 patients) meeting the criteria: randomized comparative trials in newly diagnoses MM reporting CR or CR/nCR and survival (either median survival or survival rate)
- Percent improvement in survival for each percent increase in the CR/nCR rate was calculated for each study

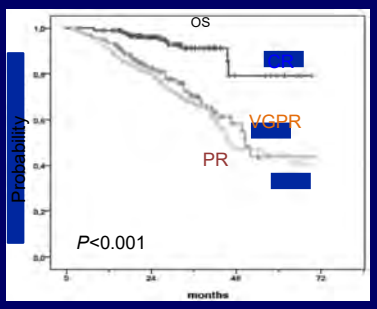
- 5 of 13 studies failed to show association: primarily due to the confounding effect of a therapy that generates high CR and is simultaneously too toxic
- Two polarizing impact of a therapy on survival (higher CR leading to longer survival vs higher toxicity leading to shorter survival) confounds analysis

Hematologic CR correlates with long-term PFS and OS in elderly patients treated with novel agents

- Retrospective analysis: 3 randomized European trials of GIMEMA and HOVON groups (N=1175)
- First-line treatment

  MP (n=332), MPT (n=332), VMP (n=257), VMPT-VT (n=254)

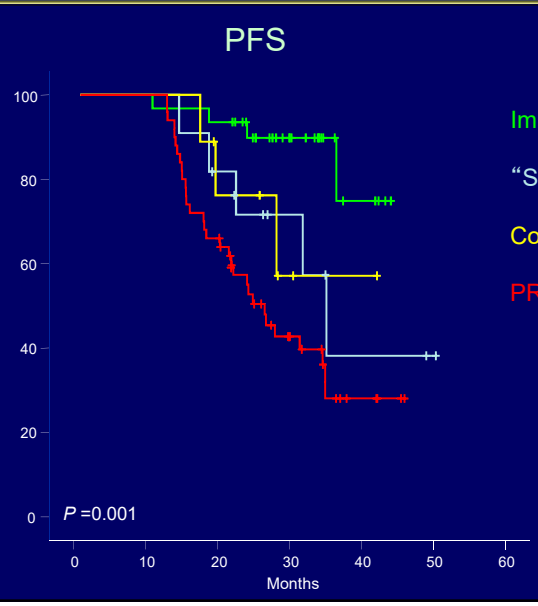




- Significant benefit also seen when analysis is restricted to patients >75 years old

Gay *et al. Blood* 2011; 117(11):3025-31

The better the quality of the response the longer the survival (Immunophenotypic CR): GEM2005>65y



Immunophenotypic CR	90% at 3y
"Stringent CR"	38% at 3y
Conventional CR	57% at 3y
PR (≥70% reduction)	28% at 3y

Paiva et al; J Clin Oncol. 2011;29(12):1627-33.

† $P = .013$.

Age Is Not a Prognostic Variable With Autotransplants for Multiple Myeloma

By D.S. Siegel, K.R. Desikan, J. Mehta, S. Singhal, A. Fassas, N. Munshi, E. Anaissie, S. Naucke, D. Ayers, D. Spoon, D. Vesole, G. Tricot, and B. Barlogie

Multiple myeloma (MM) typically afflicts elderly patients with a median age of 65 years. However, while recently shown to provide superior outcome to standard treatment, high-dose therapy (HDT) has usually been limited to patients up to 65 years. Among 550 patients with MM and a minimum follow-up of 18 months, 49 aged ≥65 years were identified (median age, 67; range, 65 to 76 years). Their outcome was compared with 49 younger pair mates (median, 52; range, 37 to 64 years) selected among the remaining 501 younger patients (<65 years) matched for five previously recognized critical prognostic factors (cytogenetics, β_2-microglobulin, C-reactive protein, albumin, creatinine). Nearly one half had been treated for more than 1 year with standard therapy and about one third had refractory MM. All patients received high-dose melphalan-based therapy; 76% of the younger and 65% of the older group completed a second transplant ($P = .3$). Sufficient peripheral blood stem cells to support two HDT cycles (CD34 > 5 × 10^6/kg) were available in 83% of younger and 73% of older patients ($P = .2$). After HDT, hematopoietic recovery to critical levels of granulocytes (>500/μL) and of platelets (>50,000/μL) proceeded at comparable rates among younger and older subjects with both first and second HDT. The frequency of extramedullary toxicities was comparable. Treatment-related mortality with the first HDT cycle was 2% in younger and 8% among older subjects, whereas no mortality was encountered with the second transplant procedure. Comparing younger/older subjects, median durations of event-free and overall survival were 2.8/1.5 years ($P = .2$) and 4.8/3.3 years ($P = .4$). Multivariate analysis showed pretransplant cytogenetics and β_2-microglobulin levels as critical prognostic features for both event-free and overall survival, whereas age was insignificant for both endpoints ($P = .2/.8$). Thus, age is not a biologically adverse parameter for patients with MM receiving high-dose melphalan-based therapy with peripheral blood stem cell support and, hence, should not constitute an exclusion criterion for participation in what appears to be superior therapy for symptomatic MM.

Autologous stem cell transplantation in elderly multiple myeloma patients over the age of 70 years

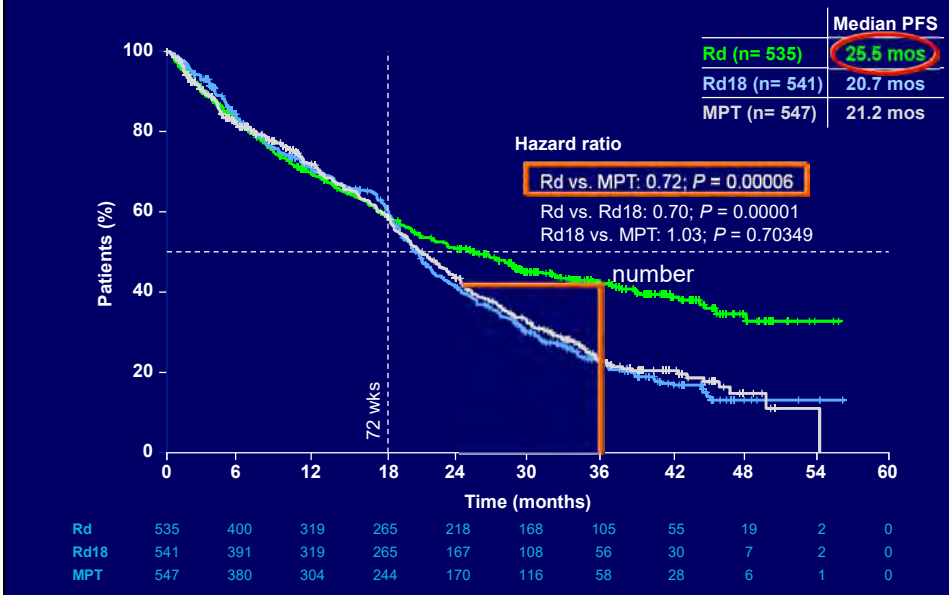
FIRST Trial: Final PFS

Continuous Rd ⬇ the risk of PFS events (PD or death) by 28% vs. MPT

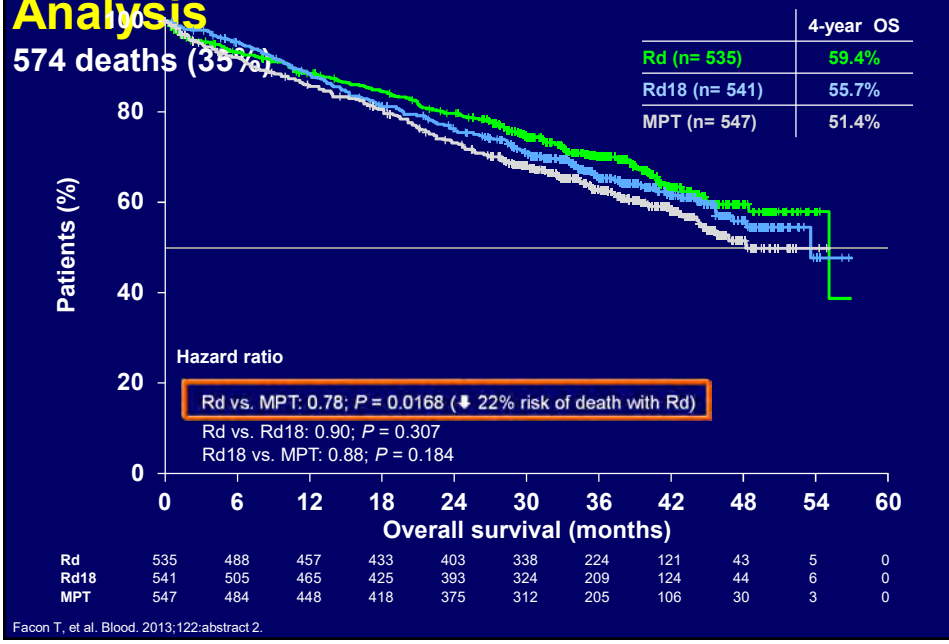


mos, months; MPT, melphalan, prednisolone, thalidomide; PFS, progression-free survival; Rd, Lenalidomide plus low-dose dexamethasone.

Facon T, et al. Blood. 2013;122:abstract 2.

FIRST Trial: Overall Survival Interim Analysis[398]

574 deaths (35%)



Facon T, et al. Blood. 2013;122:abstract 2.

The Older Fit Patient

Therapeutic Considerations:

Is CR/MRD the goal?

Is transplant the way?

Is continued treatment best?

Can novel drugs improve outcome?

A Phase 2 Study of Modified Lenalidomide, Bortezomib, and Dexamethasone (RVD lite) in Transplant-Ineligible Multiple Myeloma Patients

Induction (cycles 1-9)
Repeat q35 days × 9 cycles

Lenalidomide 15 mg po days 1-21
Bortezomib 1.3 mg/m^2 on days 1, 8, 15, 22
Dexamethasone 25 mg po days 1, 2, 8, 9, 15, 16, 22, 23 (patients =75 years old)
Dexamethasone 25 mg po days 1, 8, 15, 22 (patients >75 years old)

↓

Consolidation (cycles 10-15)
Repeat q28 days × 6 cycles

Lenalidomide 15 mg po days 1-21 (or last tolerated dose as of cycle 9)
Bortezomib 1.3 mg/m^2 sc on days 1, 15 (or last tolerated dose as of cycle 9)

↓

Maintenance (cycle 16 until progression)
Repeat q28 days until disease progression

Lenalidomide 10 mg po days 1-21 (or last tolerated dose as of cycle 15)

Elizabeth O'Donnell et al ASH 2014

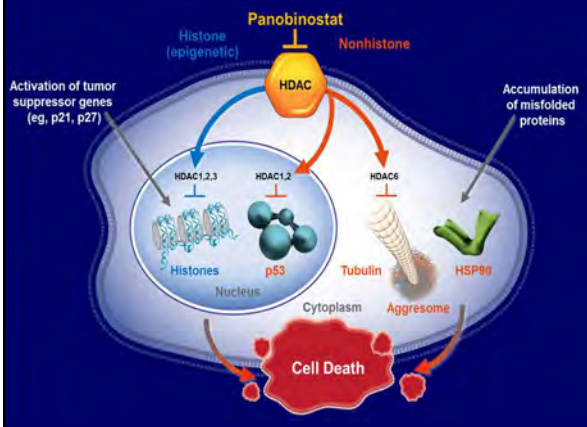
Dimopoulos ASCO & EHA 2015

MoA of DACi

Pan-DACi, such as panobinostat, inhibit a broad range of deacetylase enzymes that target both histone and nonhistone proteins involved in oncogenesis[1]



Pan-DACi inhibit growth and promote death of myeloma cells through inhibition of HDAC enzymes:

- Histone proteins, which are implicated in epigenetic dysregulation, resulting in activation of tumor suppressor genes[2-4]
- Nonhistone proteins, which promote toxic accumulation of misfolded proteins, leading to cell stress[2,5,6]

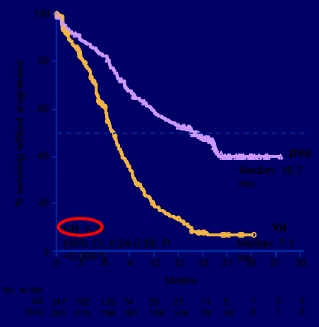
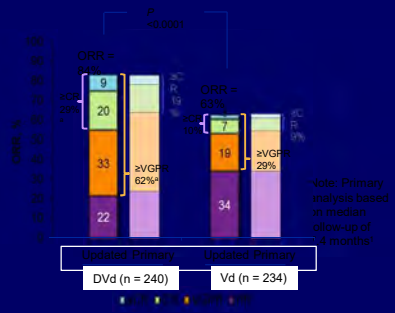
Daratumumab IV administered in 1000 mL to 500 mL; gradual escalation from 50 mL to 200 mL/min permitted

RRMM, relapsed or refractory multiple myeloma; DVd, daratumumab/bortezomib/dexamethasone; IV, intravenous; Vel, bortezomib; SC, subcutaneous; dex, dexamethasone; PO, oral; Vd, bortezomib/dexamethasone; PFS, progression-free survival; TTP, time to progression; ORR, overall response rate; VGPR, very good partial response; CR, complete response; MRD, minimal residual disease.

Castor: Dara-Vd vs Vd Updated Efficacy: ITT





Duration of response: 18.9 months for DVd versus 7.6 months for Vd

- 69% reduction in risk of progression for DVd versus Vd
- 9.6-month improvement in median PFS for DVd versus Vd
- Responses continue to deepen

HR, hazard ratio; CI, confidence interval; PR, partial response; sCR, stringent complete response
1. Palumbo A, et al. *N Engl J Med*. 2016;375:754-766.
*P <0.0001 for DVd versus Vd

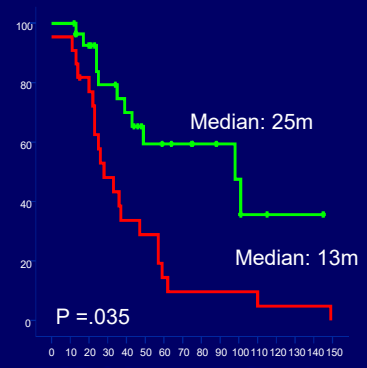
Is it possible and important to achieve MRD- in RRMM?

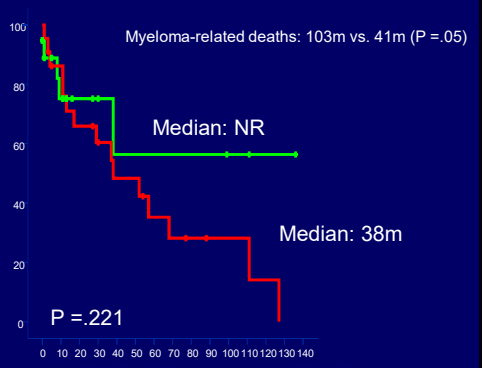
MRD monitoring by 4-color flow: R/R patients

- 43 patients in CR after salvage therapy (81% treated w/o novel agents; 63% received SCT)

TTP



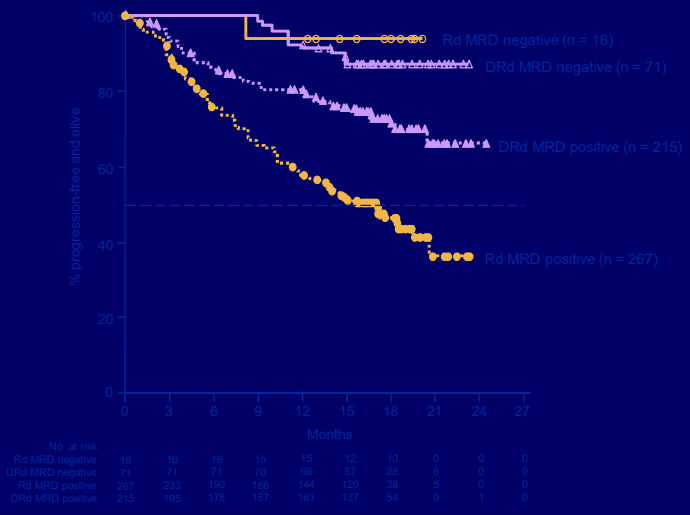
OS



Flow CR (n=20)
MRD positive

Paiva B. et al. Haematologica 2015; 100(2); median f/up: 16 months

PFS: MRD Status (10^{-5})

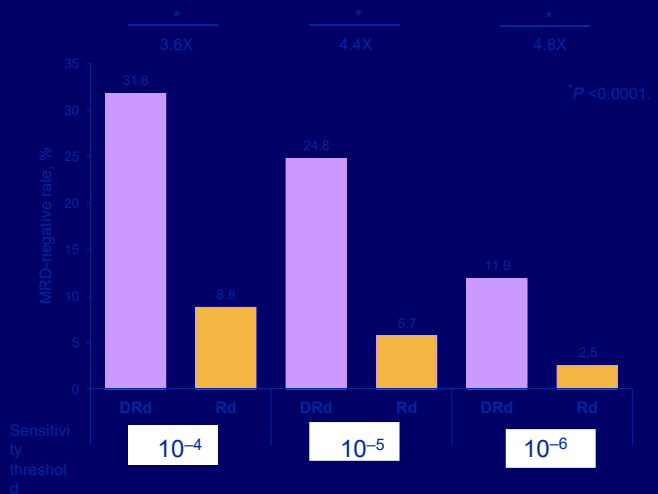


MRD negativity is associated with better outcomes

Intent to treat population

Usmani SZ, et al. ASH 2016. Abst.1151

MRD-negative Rate



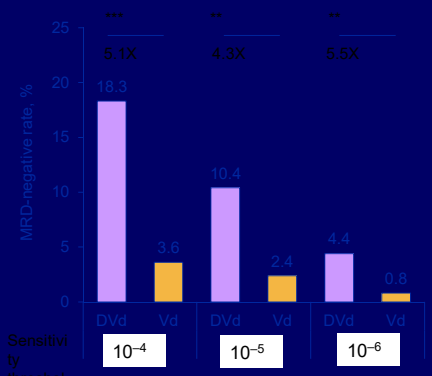
MRD-negative rates were >3-fold higher at all thresholds

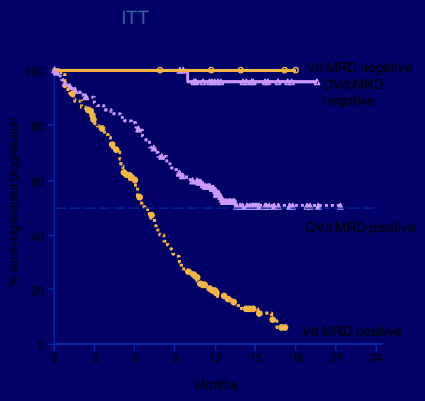
Intent-to-treat population
P values are calculated using likelihood-ratio chi-square test.

Usmani SZ, et al. ASH 2016. Abst.1151

Castor: Dara-Vd vs Vd. Outcomes by MRD rates

ITT (N = 498)





- MRD was evaluated by ClonoSEQ-NGS-based assay in a central lab at three sensitivity thresholds, for patients with suspected CR and also for patients who maintain CR at C9 and C15

MRD-negative rates for DVd were ≥3-fold higher across all thresholds
MRD negativity is associated with better outcomes

***P <0.0001, * P=0.011, NS, not significant.
P values calculated using likelihood-ratio chi-square test.
MRD-negativity rate = proportion of patients with negative MRD test results at any time during treatment.

Mateos M, et al. Presented at ASH 2016 (Abstract 1150), oral

Usmani S. ASH 2015. Abs. 29

PAVO: Study Design

Phase 1b, open-label, multicenter, dose-finding, proof of concept study

Key eligibility criteria
- RRMM with measurable disease
- ≥2 prior lines of treatment
- Not received anti-CD38 therapy

Group 1 (n = 8)
DARA: 1,200 mg
rHuPH20: 30,000 U

→

Group 2[a] (n = 45)
DARA: 1,800 mg
rHuPH20: 45,000 U

Primary endpoints
- C_{trough} of DARA at Cycle 3/Day 1
- Safety

Secondary endpoints
- ORR
- CR
- Duration of response
- Time to response

Dosing schedule
- Approved schedule for IV
- 1 Cycle = 28 days

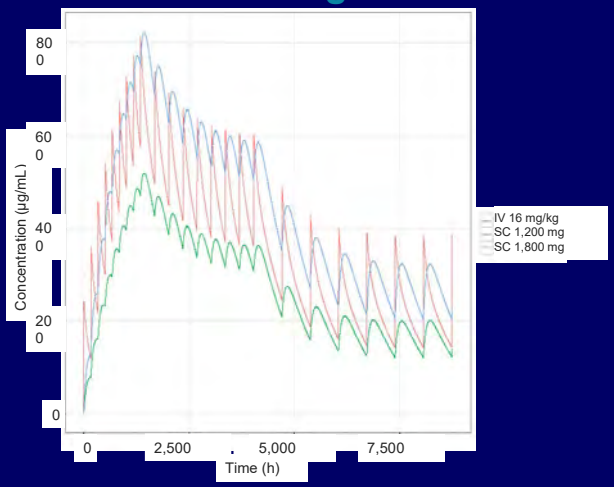
Infusion time
- 1,200 mg: 20-min infusion (60 mL)
- 1,800 mg: 30-min infusion (90 mL)

Pre-[b]/post-infusion medication
- Acetaminophen, diphenhydramine, montelukast, and methylprednisolone

RRMM, relapsed or refractory multiple myeloma; QW, weekly; Q2W, every 2 weeks; Q4W, every 4 weeks; C_{trough}, trough concentration; DRR, overall response rate; CR, complete response; PK, pharmacokinetic
[a]Group 2 comprises 4 distinct cohorts, each treated with DARA 1,800 mg and rHuPH20 45,000 U; C_{trough} on Cycle 3/Day 1 in Group 1 supported dose selection for Group 2. The study evaluation team reviewed safety after Cycle 1 and PK after Cycle 3/Day 1 for each cohort.
[b]Administered 1 hour prior to infusion.

Usmani S, et al. Presented at ASH 2016 (Abstract 1149), oral

Simulation of Mean Concentration-Time Profiles of DARA Following SC and IV Dosing[a]



- Similar C_{max} for SC 1,800 mg versus IV 16 mg/kg overall
- Lower C_{max} for SC 1,800 mg during the initial weekly administration
- Higher C_{trough} for SC 1,800 mg versus SC 1,200 mg

C_{max}, peak plasma concentration
[a]Dosing schedule is QW in Cycles 1 to 2, Q2W in Cycles 3 to 6, and Q4W thereafter

Usmani S, et al. Presented at ASH 2016 (Abstract 1149), oral

Safety

- AE profile of DARA-PH20 was consistent with IV DARA
- No treatment discontinuations due to TEAEs were observed in the 1,800-mg
- **IRRs**

	1,200 mg n = 8	1,800 mg n = 45
IRR, % (n)	**13** (1)	**24** (11)
Chills	**13** (1)	**9** (4)
Pyrexia	**0** (0)	**9** (4)
Pruritus	**0** (0)	**4** (2)
Dyspnea	**13** (1)	**0** (0)

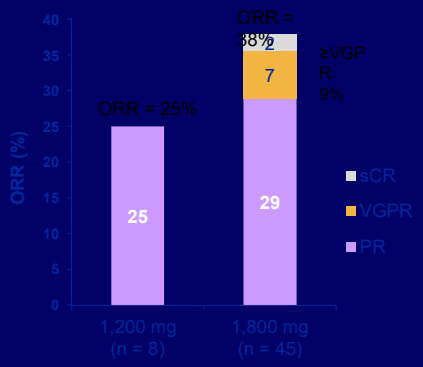
PR	**25** (2)	**29** (13)
MR	**13** (1)	**11** (5)
SD	**50** (4)	**38** (17)
PD	**13** (1)	**13** (6)



- Responses to DARA-PH20 were observed across both groups

Deeper responses were observed in the 1,800-mg group

Response-evaluable set.
sCR, stringent complete response; VGPR, very good partial response; PR, partial response; MR, minimal response; SD, stable disease; PD, progressive disease.

Usmani S, et al. Presented at ASH 2016 (Abstract 1149), oral

Conclusions

- Identify Biochemical relapses → Does this patient require treatment?
- Early relapses (1-3 prior):
  - Len-Dex substituted by K-Rd; Elo-Rd; I-Rd; Dara-Rd;
  - Non Len-Dex combinations: Kd; Panob-Bd and Dara-Bd
- Late relapses (>2-3): Bendamustine, Pom-Dex; Daratumumab
- Probably the problem has changed
  - What else can I prescribe to this patient? → How should I choose?
    - Based on: Efficacy & Tox of prev. Tx; Type of Relapse; Age; Cost; Cytogenetics
- Continue including patients in clinical trials so in the next 10 years

Amyloidosis: "Under-diagnosed disorder"

Joan Bladé
Amyloidosis and Myeloma Unit
Hospital Clinic of Barcelona

Santiago de Chile, 12 de Agosto, 2017

Concept of Amyloidosis

- Group of “rare” diseases characterized by extracellular deposition of amyloid fibrils (Congo red +) in organs and tissues

Pathogenesis

Increased synthesis, specific mutations or aging of autologous proteins (amyloidogenic precursor proteins)

Conformational changes and aggregation forming amyloid fibrils (Congo-red positive)

Deposition of amyloid fibrils in tissues cause functional damage of involved organs, and eventually (if untreated) leads to death

Types of Amyloidosis

Can be classified according to:

- Localized versus systemic
- Acquired versus hereditary
- Different amyloidogenic precursor proteins

Most Common Forms of Systemic Amyloidosis **99%**

Precursor protein	Main synthesizing organ	Amyloid type
Ig Light chain	**Bone marrow**	**Ig LC amyloidosis = AL amyloidosis** **75%**
Serum amyloid A protein	Liver	Secondary (reactive) amyloidosis = AA amyloidosis
Wild type transthyretin	Liver	Senile systemic amyloidosis (SSA) = wild type ATTR amyloidosis
Mutated transthyretin	Liver	Hereditary ATTR amyloidosis = hereditary ATTRV30M amyl.
Mutated apolipoprotein A1	Liver, GI tract	Hereditary AApoAI amyloidosis

Localized Amyloidosis

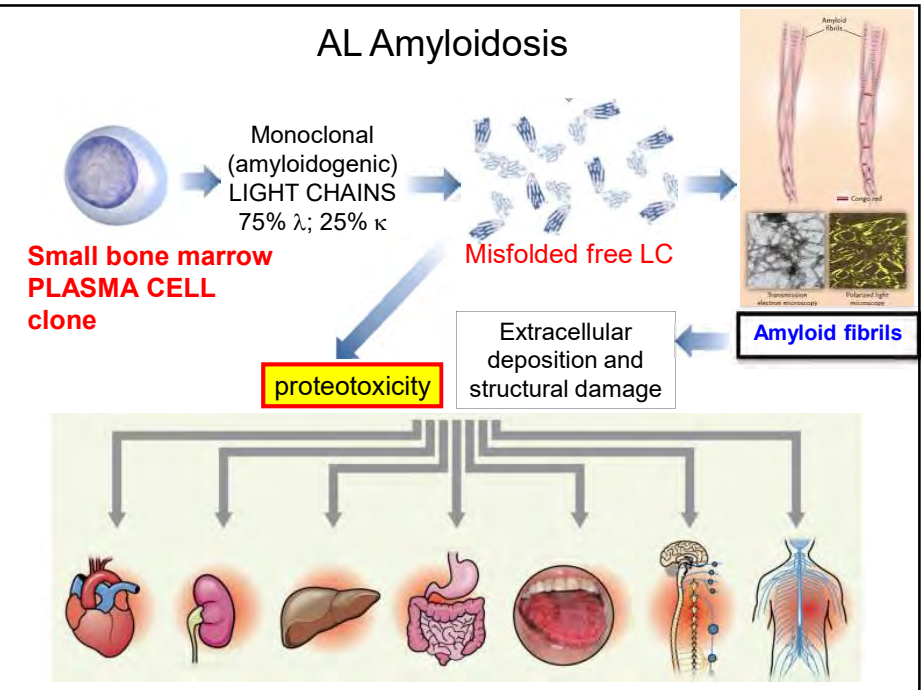
- Local formation and deposition of light chain (AL) amyloid fibrils, confined to a single site (WITHOUT an underlying systemic plasma cell disorder)
- Sites:
  - tracheo-bronchial tree (upper resp tract, nasopharynx),
  - urinary tract (bladder),
  - skin and nails,
  - GI tract,
  - Others (lymph nodes, orbit, …)
- Treatment: LOCAL, if needed (surgery, laser, RDT…)
- Low risk of progression to systemic AL amyloidosis

Light Chain Amyloidosis (AL Amyloidosis)

Epidemiology

- Incidence: 4-10 patients/million/year
- Aprox. one-fifth as common as multiple myeloma
- Median age at diagnosis: 64 years
  (<5% of patients are < 40 years-old)
- Male predominance: 2/3 of patients (referral bias?)
- Median survival (untreated patients): 10-14 months

AL Amyloidosis



Merlini & Stone, Blood. 2006

Monoclonal Gammopathy

- M protein by electrophoresis (moderate size): 50%
- M protein by immunofixation: 90-95%
- Isotype:
  - 32% IgG
  - 24% Bence-Jones
  - 10% IgA,
  - 5% IgM
  - 1% IgD
- Light chain isotype: LAMBDA (75%)
- Bone marrow plasma cell infiltration: 5-10%
  (>20% in about ¼ patients)
- No CRAB

Main clinical manifestations

- Fatigue and anorexia (weight loss)
- Organ involvement
  - Kidney, 70-80%
  - Heart, 50-70%
  - Liver, 20%
  - Peripheral / autonomic neuropathy, 20%/15%
  - Gastrointestinal, 8% (only 1% symptomatic)
  - Soft tissue, 12%

Renal involvement (70-80%)

- Glomerular proteinuria evolving to overt nephrotic syndrome (hypercholesterolemia, edema)
- Less frequently renal failure progressing to ESRD
  - Serum creatinine > 2 mg/dL in 20% patients

Cardiac involvement (50-70%)

- Restrictive cardiomyopathy
- Congestive heart failure
- Arrhythmias (syncope or sudden death)
- Rarely angina or infarction
- Elevation of cardiac biomarkers
  (NT-proBNP, troponin T or I)

Cardiac involvement (50-70%)

- ECG: low voltages +/- pseudoinfarct pattern
- Echo: LV concentric hypertrophy
  - Thickening of LV and RV walls, interventricular and interatrial septa (>12 mm)
  - "Granular sparkling"
  - Normal LV ejection fraction (reduced in advanced disease)

- Cardiac MR: late gadolinium enhancement

Liver involvement (20%)

- Hepatomegaly

  (Amyloid infiltration versus congestive heart failure in patients with cardiac amyloidosis)
- Elevated alkaline phosphatase
- Rarely elevated bilirubin

  (bilirubin > 5 mg/dL ➡ survival <1 month)
- Kappa clones more frequently found (30-40%)

Nervous system involvement

Peripheral neuropathy (PN) (20%)

- Symmetric distal sensori(motor) PN
- Seldom isolated (2%) in contrast with PN in ATTR-V30M

Autonomic neuropathy (15%)

- Postural hypotension
- Impotence
- Bowel dysfunction (severe diarrhea to constipation)

GI involvement

- Bleeding (due to vascular fragility and loss of vasomotor responses to injury)
- Gastroparesis
- Malabsorption
- Constipation
- Intestinal pseudo-obstruction (dysmotility)

Other clinical manifestations (I)

- Periorbital purpura (15%)

- Macroglossia (10%)
- Submandibular swelling
- Hoarse or weak voice
- Dry mouth
- Jaw claudication

Other clinical manifestations (II)

- Carpal tunnel syndrome (25%)
- Factor X deficiency (10-15%)
- Muscular pseudohypertrophy, articular deposits, shoulder pad sign
- Splenomegaly (5%)
  - Hyposplenism in 25% of patients
- Pulmonary/pleural involvement (<5%)

Diagnosis

1. Clinical suspicion:
   - ⇨ Any clinical manifestation
   - ⇨ Serum and/or urine M component
2. Confirmatory biopsy:
   - ⇨ Amyloid deposition (Congo Red +)
   - ⇨ Typing by immunohistochemistry (k or λ LC)
3. Gold-standard of congophilic deposits typing: Proteomics (LMD/MS)

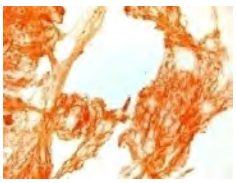
Cohen AD, Comenzo RL. ASH 2010.

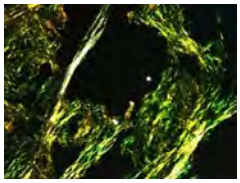
Serum Free Light Chain (FLC)

- Ig FLC is the precursor of amyloid
- FLC assay (Freelite)
- Role in diagnosis: Abnormal FLC in 90% of patients
- Role in disease monitoring:
  - "Measurable" by M-protein in 25% of patients
  - "Measurable" by FLC in >50% of patients
- Independent prognostic value

Proving systemic amyloid deposition

Diagnosis of amyloidosis relies on Congo red staining of tissue biopsy



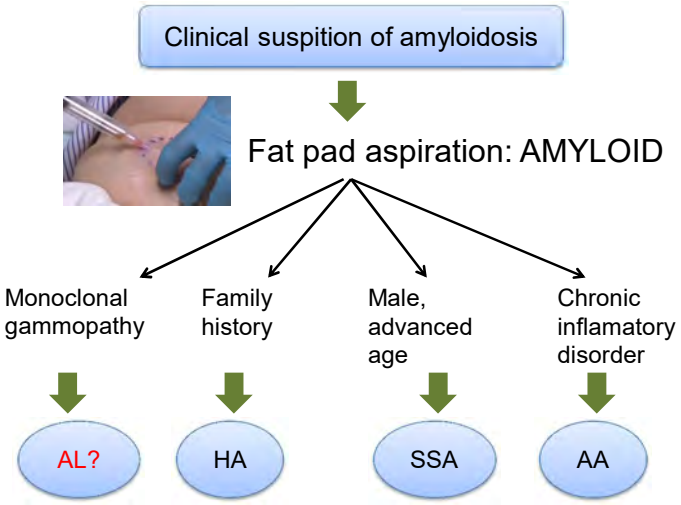


- Tissue of choice: **abdominal fat** (sensitivity 88%)
- **If negative** → labial minor **salivary glands** (S: 58%) or **rectum**
- **If negative** → **involved organ** (kidney, liver, heart,…)

  (hemorrhagic risk!!)

Courtesy of Dr. Merlini

Differential Diagnosis



Treatment Approaches in Systemic Amyloidosis

Amyloid type	Treatment options
AL amyloidosis	Chemotherapy
AA amyloidosis	Treatment of underlying disease
Senile systemic amyloidosis (SSA)	Treatment of heart failure, heart Tx
Hereditary ATTR amyloidosis	Liver Tx
Hereditary AApoAI amyloidosis	Liver Tx

Typing by immunohystochemistry

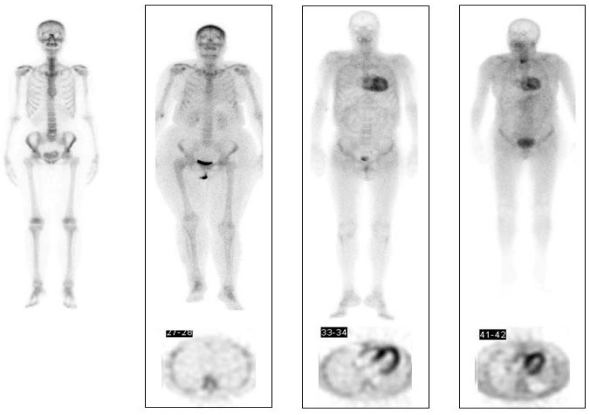
Gammagrafía ^{99m}Tc-DPD



Control AL TTR TTR

Perugini et al, J Am Coll Cardiol 2005

Looking for Organ Involvement

- Thorax X-ray
- ECG and echocardiogram
- Holter (suspected arrhythmia)
- Cardiac MR (unclear echo)
- Skeletal survey (bone pain)
- Electrophysiological studies (suspected polyneuropathy)
- GI endoscopic study (suspected GI involvement)

AL Prognosis

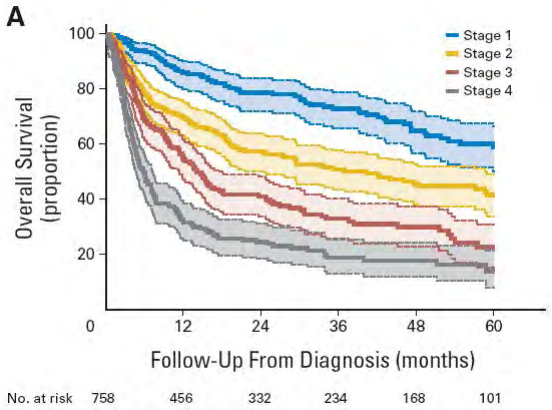
- Cardiac involvement → cardiac biomarkers
- Tumor burden → serum free light chains
- Response to therapy

Revised Prognostic Staging System (I)

Kumar et al, JCO 2012 (Mayo Clinic)

- N: 810 newly AL
- **Prognostic factors for OS**
  - FLC-diff ≥ 180 mg/L
  - cTnT ≥ 0.025 ng/mL
  - NT-proBNP ≥ 1800 pg/mL

Revised Prognostic Staging System (II)



Median OS:

- I: 94 mos.
- II: 40 mos.
- III: 14 mos.
- IV: 5,8 mos.

Hem Response (HR) Evaluation

	Gertz et al, 2005
CR	Negative serum and urinary immunofixation Normal FLC ratio BMPC <5%
PR	If serum M protein >5 g/L → 50% ↓ If urinary M protein > 100 mg/day → 50% ↓ If iFLC > 100 mg/L → 50% ↓
SD	No CR, PR or progression

	Palladini et al, 2012
aCR	= ¿BM needed?
VGPR	**dFLC* <40 mg/L**
PR	**dFLC* decrease >50%**
SD	No response

* Baseline dFLC must be ≥50 mg/L

Cardiac Response Evaluation

	Gertz et al, 2005	Palladini et al, 2012
Response	↓ IVSd (≥ 2 mm) or ↑ EF (20%) or ↓ NYHA (2 classes) No ↑ in diuretic use No ↑ in wall thickness	**NT-proBNP* ↓ >30% and >300 ng/L** NYHA class response (2 classes)
Progression	↑ IVSd (2 mm) ↑ NYHA (1 grade) with a ↓ EF of ≥ 10%	**NT-proBNP* ↑ >30% and >300 ng/L** **cTn (I or T) ↑ >33%** EF ↓ by 10% or more

* If baseline level of NT-proBNP > 650 ng/L

Important: prognostic value of NT-proBNP at 3 and 6 months; prognostic value of cTn only at 6 months after start of therapy

Renal Response Evaluation

	Gertz et al, 2005	Palladini et al, 2014** (at 6 months)
Response	– ≥ 50% ↓ (at least 0.5 g/day) of 24-hr urine protein* – Serum creat and creatCl must not worsen by 25% over baseline	– ≥ 30% ↓ of 24-hr urine protein or below 0.5 g/24h – No renal progression
Progression	– ≥ 50% ↑ of 24-hr urine protein to at least 1g/day – or ≥ 25% worsening of serum creat or creatCl	– ≥ 25% worsening of eGFR

* If baseline level 24-hr urine protein > 0.5 g/day

** Palladini et al, Blood 2014;124:2325-32. N= 461 (validation cohort: 271).

Take-Home Message

- Most important: **early diagnosis**
  - ➡ early initiation of the most effective therapy

Rajkumar Mayo Clin Proc. 2010; 85: 945

Macroglobulinemia de Waldenström

Baja frecuencia
- 6% of todas la gammapatías monoclonales
- 2-5 casos/mill/año (GEM, 3'1) 2500 casos/año en Europa

Edad avanzada
- Mediana: 71. Masculino/Femenino: 2:1

Historia Natural
- Enfermedad indolente, supervivencia media: 11 años
- 1/3 muere por otras causas; 2/3 mueren de MW

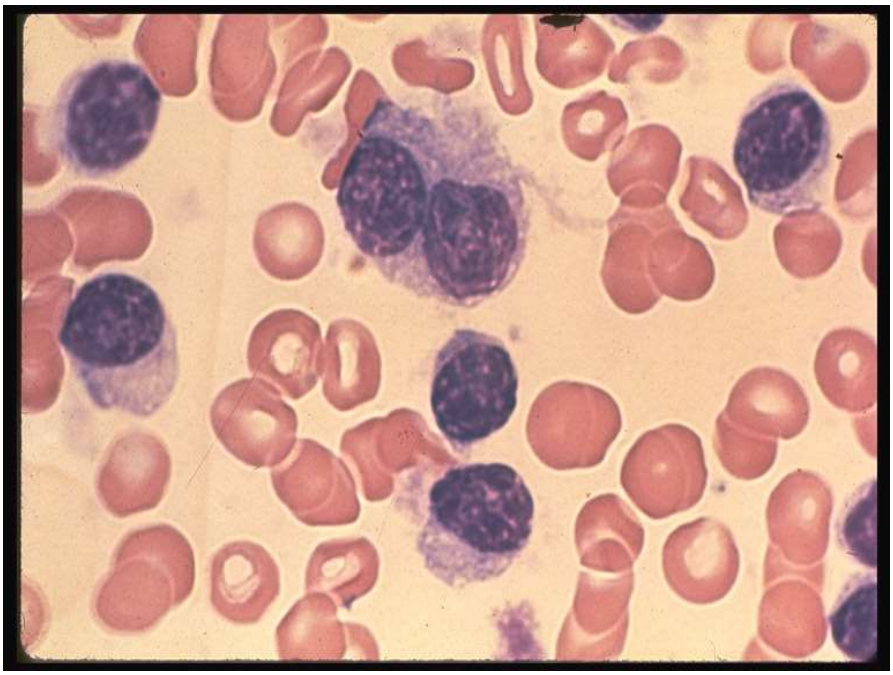
Tratamiento eficaz

Interés biológico

Definición de MW

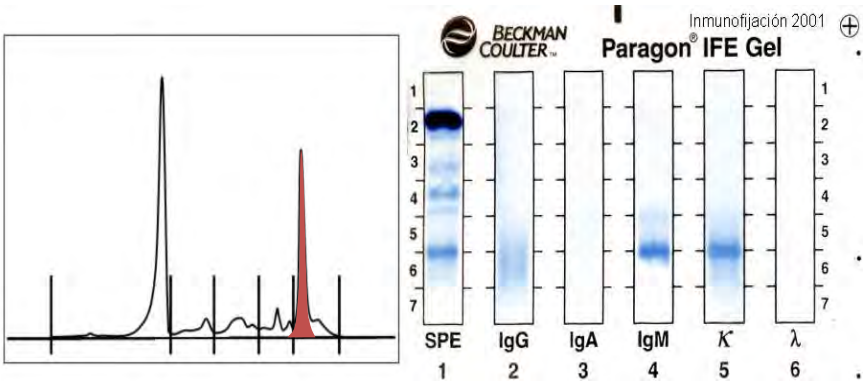
- Trastorno linfoproliferativo raro caracterizado primariamente por infiltración de médula ósea y presencia de componente monoclonal IgM.

- El trastorno patológico subyacente en la MW es el linfoma linfoplasmocítico tal y como lo define las clasificaciones OMS [(WHO) World Health Organization] y REAL (Revised European-American Lymphoma).



Protein Electrophoresis

Immunofixation



Clasificación de Gammapatías IgM

	Proteína monoclonal IgM[1]	Infiltración medular[2]	Síntomas atribuibles a la IgM	Síntomas atribuibles a infiltración[3]
MW Sintomática	+	+	+ (4)	+ (4)
MW Asintomática	+	+	–	–
Trastorno tipo IgM[5]	+	–	+	–
GMSI IgM	+	–	–	–

1) No se precisa un umbral de concentración de IgM para distinguir GMSI de MW, aunque la concentración de IgM raramente supera los 3 g/dL en la GMSI; 2) Si un paciente tiene infiltración medular inequívoca por linfoma linfoplasmocítico, tiene MW; si no hay evidencias, se considerará GMSI. Sin embargo, hay pacientes con evidencias equívocas de infiltración de MO: ej. detección de células B clonales por citometría de flujo o PCR sin evidencias morfológicas de infiltración; o infiltrados equívocos de MO sin estudios confirmatorios de clonalidad. En tanto no haya más datos, estos pacientes se clasifican como GMSI 3) Los síntomas atribuibles a infiltración tumoral incluyen: síntomas constitucionales, citopenias y organomegalias. 4) Se requiere la presencia de uno o ambos grupos de síntomas. (5) Población de pacientes que tienen síntomas atribuibles a la proteína monoclonal IgM, pero no tienen evidencias de células tumorales. Ej: crioglobulinemia sintomática, amiloidosis o fenómenos autoinmunes tales como isquemia periférica y crioaglutininemia. Estos pacientes son un grupo clínicamente distinto y se propone el término "trastornos relacionados con IgM"

Owen et al, Sem Hematol 2003, 30:110-115

BIOPSIA ÓSEA OBLIGATORIA

Essential evaluation of patients with Waldenström Macroglobulinaemia (WM)

Evaluation
- History and physical examination
- Include familial history for WM and other B-cell lymphoproliferative disorders
- Include funduscopic examination
- Review of systems

Laboratory studies
- Complete blood count
- Complete metabolic panel
- Serum immunoglobulin levels (IgA, IgG, IgM)
- Serum and urine electrophoresis with immunofixation
- Serum beta-2-microglobulin level

If clinically indicated
- Cryoglobulins
- Cold agglutinin titre
- Serum viscosity
- Screening for von Willebrand disease
- 24-h urine protein quantification

Bone marrow aspiration and biopsy Immunohistochemistry
- Flow cytometry
- Testing for MYD88 L265P gene mutation

Computerized tomography scans of the chest, abdomen and pelvis with intravenous contrast
- In patients being considered for therapy

Castillo JJ, Garcia-Sanz R, E Hatjiharissi, et al. Br J Haematol 2016, 175, 77–86

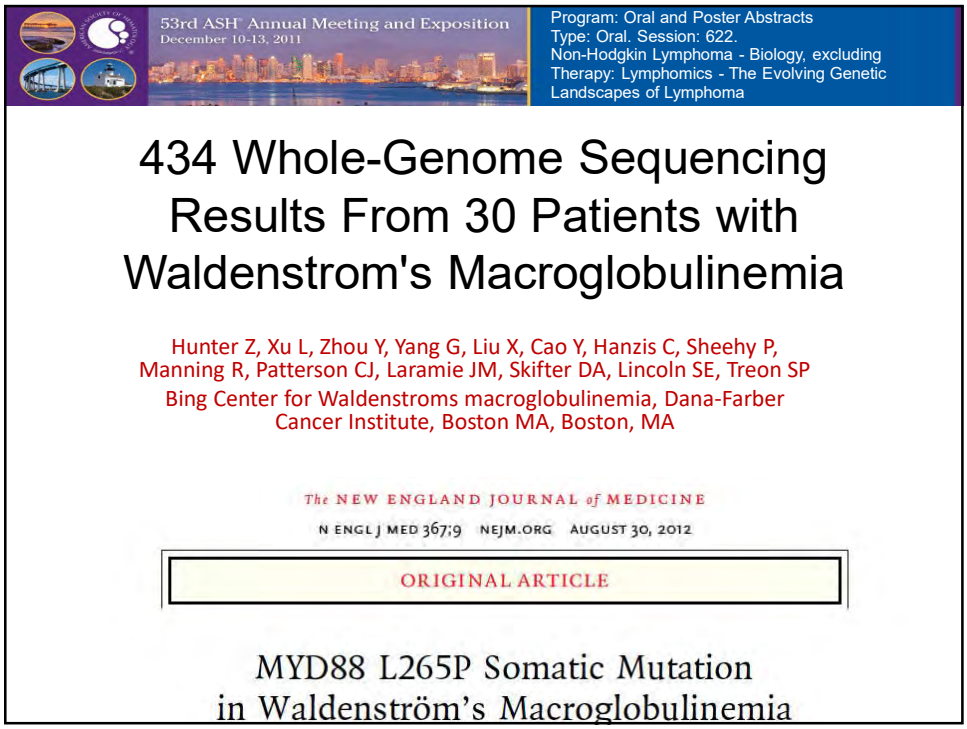
** Poor prognosis*



Whole genome sequencing in WM

- Paired malignant (WM LPC) and normal (CD19-depelted PBMC) cell genomes from **10 WM** patients were sequenced
- Genome from BM LPC alone were sequenced for additional **20 WM** patients
- Results were validated by Sanger sequencing and included a cohort of WM, IgM MGUS , MM patients and healthy donors

Zachary Hunter ASH 2011, 434a

Results

Tumor and normal genomes were both sequenced to an average of 66X (range 60-91X) coverage of mapped individual reads. The average gross mapped yield for these genomes was 186.89 (range 171.56-262.03 Gb).

Acquired copy number changes were common:

- Losses: chromosome 6q (13/30; 43%),
- Gains:
  - –chromosome 4 (7/30; 23%)
  - –6p (3/30; 10%)
- Large regions of CNLOH were observed in 9/30 (30%) of patients occurring in chromosomes 1, 2, 3, 5, 9, 11, 17, 21, and X.

Results

Involved Gene	Frequency
Myeloid differentiation primary response (MYD88) gene (38182641 in chromosome 3p22.2): 265 leucine → proline (L265P)	26/30 (86.7%) 4/26 (15%) Homozygous, due to CNLOH
Transporter 2, ATP-binding cassette, sub-family B (TAP2) gene	7/30 (23%)
Chemokine (C-X-C motif) receptor 4 (CXCR4) gene	6/30 (20%)
Low density lipoprotein receptor-related protein 1B (LRP1B) gene	5/30 (17%)
Mesothelin (MSLN) gene	4/30 (13%)
AT rich interactive domain 1A (ARID1A)	3/30 (10%)
Histone cluster 1, H1e (HIST1H1E)	3/30 (10%)
Rap guanine nucleotide exchange factor 3 (RAPGEF3)	3/30 (10%)

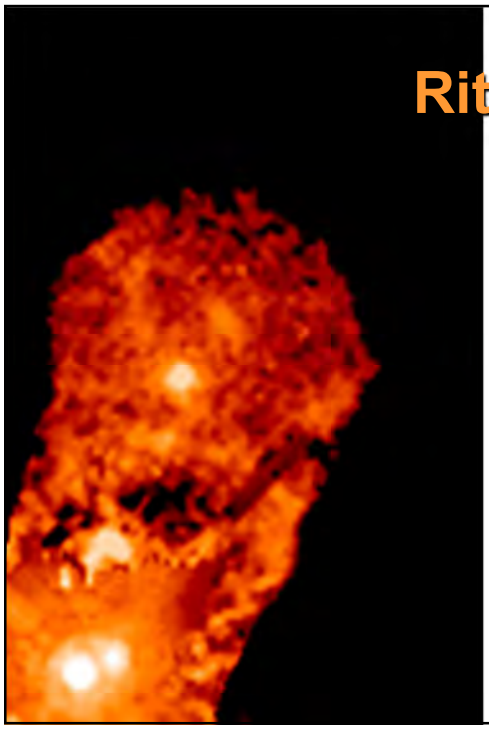
Waldenström's Macroglobulinemia Treament in Previously untreated patients

Anti-CD20

and…

1. Alkylating agents
2. Nucleoside analogues

3. Immunomodulatory agents (IMiDs)
4. Bortezomib

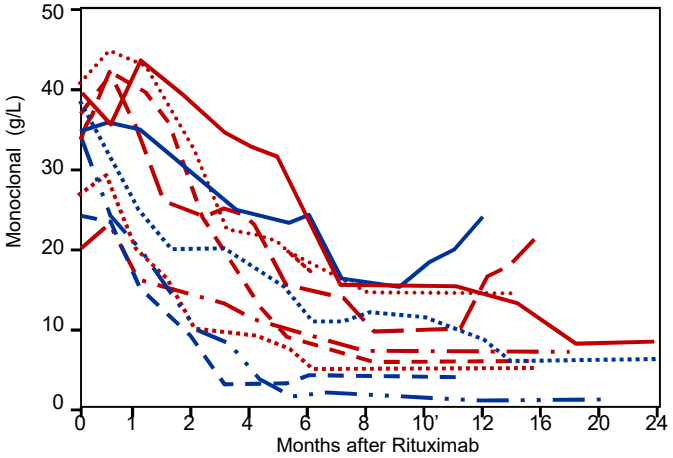


Rituximab in WM

Flare

flamme

Treatment of newly diagnosed patients with Rituximab: IgM Flare



15-30 days after treatment,
increase by ≥ 25% in 50-73%, may persist up to 4 m.
Associated with decreased response rate

Dimopoulos et al JCO, 2002,
Treon et al Ann Oncol, 2004,
Ghobrial et al Cancer 2004

DRC regimen

- Dexamethasone 20 mg IV day 1
- Rituximab 375 mg/m^2 IV day 1
- Cyclophosphamide 100 mg/m^2 PO BID days 1-5 (total dose 1000 mg/m^2)

DRC courses are repeated every 21 days for 6 courses

Dimopoulos J Clin Oncol 2007; Kastritis Blood 2016

DRC regimen

- N=72
- CR = 7%
- PR = 67%
- MR = 9%
- SD = 8%
- PD = 8%

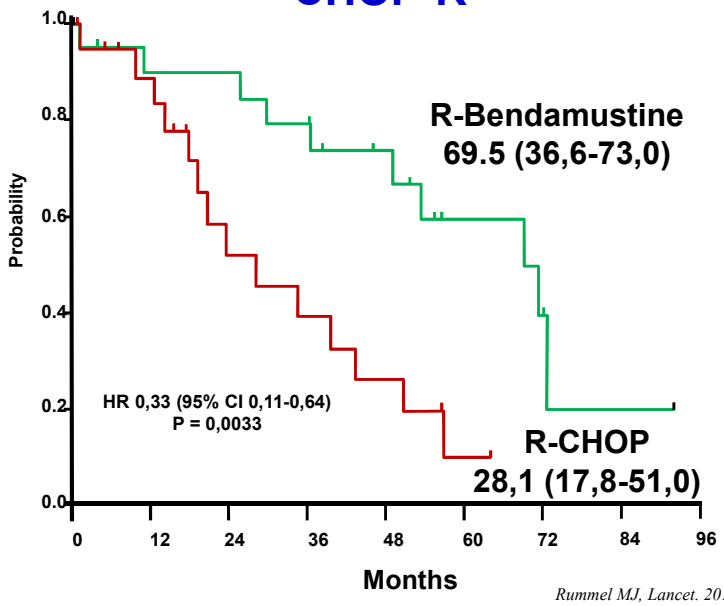
ORR = 83%

Median time to 50% IgM reduction was 4.1 months (range, 0.7-14)

IgM flare in 32%, ≥25% IgM increase in 11%

Dimopoulos J Clin Oncol 2007; Kastritis Blood 2016

Progression Free Survival for WM: B-R vs. CHOP-R



Rummel MJ, Lancet. 2013, 6736: 61763-2

Bortezomib in WM

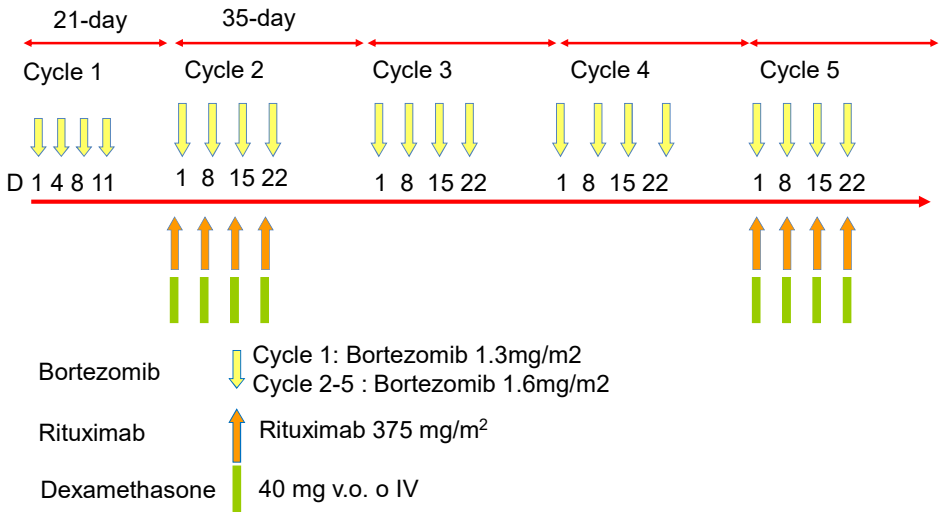
European Myeloma Network Multicenter Protocol



Dimopoulos et al Blood 2011; Gavriatopoulos et al, Blood 2016

CaRD

- Induction
  - Carfilzomib IV,
    - 20 mg/m^2, infused over 20 minutes (cycle 1 only)
    - 36 mg/m^2 infused over 30 minutes (for cycles 2 and beyond)
  - Dexamethasone IV, 20 mg, given on days 1-2 & 8-9
  - Rituximab, 375 mg/m^2, days 2 and 9

  Every 21 days for 6 cycles

- Maintenance (for stable disease or better), 8 weeks later:
  - Carfilzomib IV, 36 mg/m^2, D1 & D2
  - Dexamethasone IV, 20 mg, D1 & D2
  - Rituximab, 375 mg/m2, D2 only

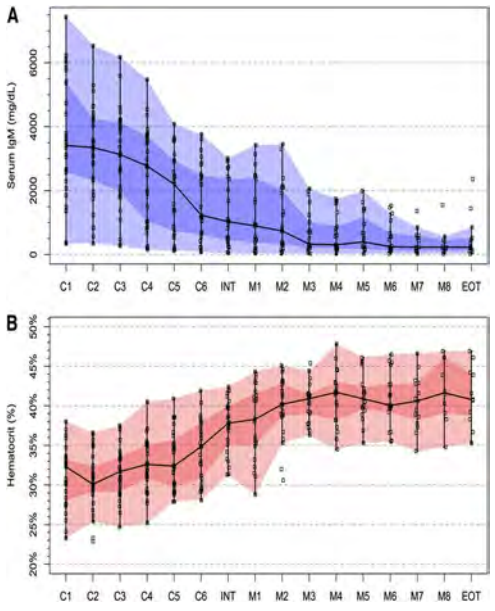
  Every 8 weeks for 8 cycles.

Treon et al, *Blood*. 2014;124:503-510)

CaRD regimen (1st-2nd line, no prior PI)

- N=31
- CR = 1
- VGPR = 10
- PR = 10
- MR = 6)
- NR = 4

ORR = 87%



PI: proteasome inhibitor; CR: complete response; VGPR: Very good partial response; Partial Response; MR: minor response; NR: no response.

Treon et al Blood 2014

CaRD, toxicitity

Table 2. Adverse events possibly, probably, or definitely associated with protocol therapy

Toxicity type	Any grade	Grade 1	Grade 2	Grade 3	Grade 4
Anemia	3 (9.7%)	0 (0%)	2 (6.5%)	1 (3.2%)	0 (0%)
Arthralgia	3 (9.7%)	3 (9.7%)	0 (0%)	0 (0%)	0 (0%)

Peripheral neuropathy	6 (19.4%)	5 (16.1%)	1 (3.2%)	0 (0%)	0 (0%)
Rash	9 (29.0%)	6 (19.4%)	3 (9.7%)	0 (0%)	0 (0%)

2956 Ixazomib, Dexamethasone and Rituximab in previously untreated patients with Waldenstrom Macroglobulinemia (Castillo JJ)

Phase II

Induction: six 4-week cycles

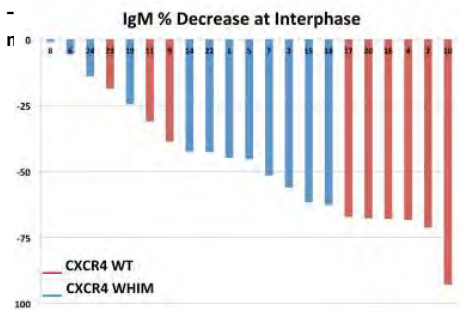
Ixazomib 4 mg 1, 8 , 15
Dexamethasone 20 mg 1,8,15
Rituximab 375 mg/m2 IV 1

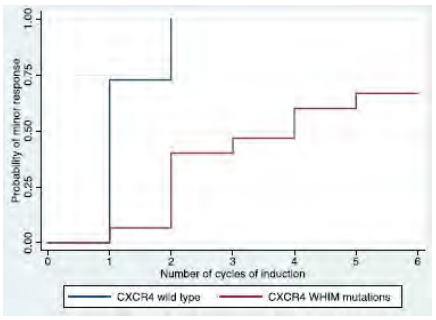
Maintenance: Six 8-week cycles

Characteristic	Patients (N=26)
Age at WM diagnosis – yr	63 (46-81)
Age of treatment initiation – yr	65 (46-82)
Hemoglobin – g/dL	10.2 (6.9-13.2)
Serum IgM – mg/dL	5,068 (653-7,650)
Bone marrow involvement - %	55 (5-95)
Lymphadenopathy – no. (%)	46 (12)
Splenomegaly	12 (3)
MYD88 L265P	100 (26)
CXCR4 WHIM	58 (15)
Nonsense	67 (10)
Frameshift	33 (5)
Criteria for treatment initiation – no. (%)	13 (48.1)
Anemia	1 (3.8)
Symptomatic splenomegaly	7 (27)
Hyperviscosity	4 (15.4)
Peripheral neuropathy	5 (19.2)
Constitutional symptoms	1 (3.8)
IgM >6,000 mg/dL	1 (3.8)
Pancytopenia	

2956 Ixazomib, Dexamethasone and Rituximab in previously untreated patients with Waldenstrom Macroglobulinemia (Castillo JJ)

Results: (of the 16 patients completed induction)
-Median Time To Response : 8 weeks
-ORR : 80% (VGPR 5%, PR 45%, MR 30%)
-The median time to Minor Response in CXCR4mut was 4 cycles vs 1 cycle en CXCR4wt
-Major response (VGPR+PR) were observed in 40% CXCR4mut patients vs 55% CXCR4wt





Conclusion: IDR active,well tolerated, no PN. CXCR4 mutation affect time /dept of response

Waldenström's Macroglobulinemia Treatment in Previously treated patients

- **"Late" Relapses after initial response (>12 months)**
  - Same prior line or another 1st line protocol
- **"Early" relapses after initial response, and primary or secondary relpases:**
  - Switch for another first line
  - "Conventional" Lymphoma strategy:
    - Polychemotherapy (plus R): CHOP, CAP, VBCMP y VAD
    - Trasplant: Auto or Alo
  - New therapies ("experimental"):
    - Bortezomib, IMiDs, Alemtuzumab, Bendamustine...
    - Everolimus
    - Carfilzomib
    - Pomalidomide
    - Panobinostat

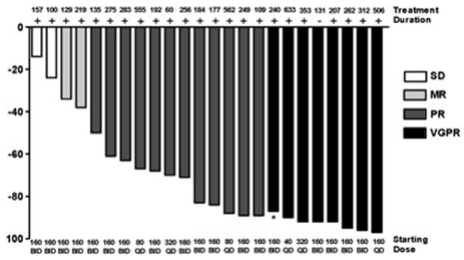
ASH2016: #1216 High Major response Rate, Including VGPR, in Patients with Waldenstrom Macroglobulinemia (WM) treated with the Highly Specific BTK inhibitor Bgb-3111:Expansion Phase Results from ongoing Phase I Study (Tam CS)

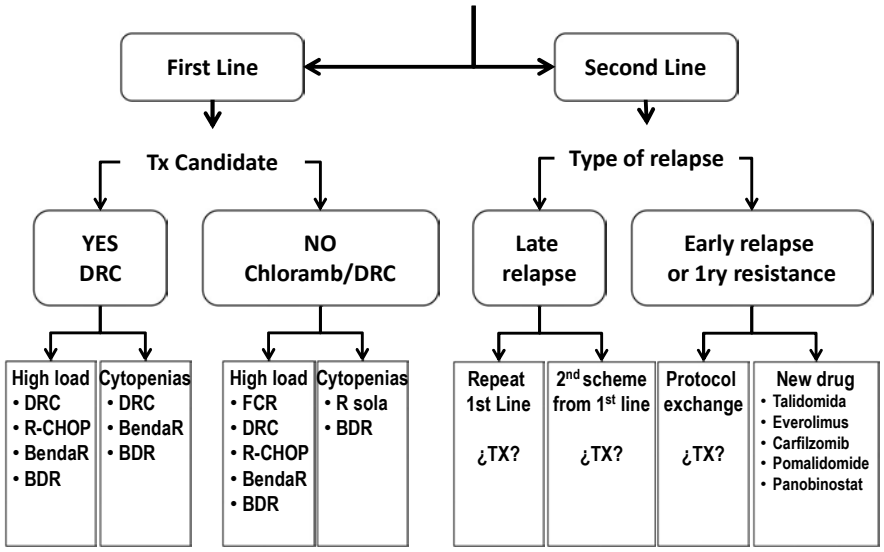
Introduction: BGB-3111 irreversible BTK inhibitor with greater selectivity and superior bioavailability
Phase I (6 ptes) 40,80,160,320 mg and **Phase 2** (25 ptes) 160, 320 mg; **24 evaluable for response**
Major Response 83% (**VGPR 33%,** PR 50%)
AE´s (1/2). Respiratory infection 25%, diarrhea 25% and nausea 21%

Age (median, range)	66 (49-79)
ECOG PS	
0	7
1	17
2	0
Number of prior therapies (n)	
0	1
1-3	21
>3	2
Types of prior therapy (n, %)	
Rituximab	21 (88%)
Alkylating agents	20 (83%)
Corticosteroids	17 (71%)
Fludarabine	7 (29%)
ASCT	2 (8%)
Refractory to prior therapy* (n, %)	13 (54%)

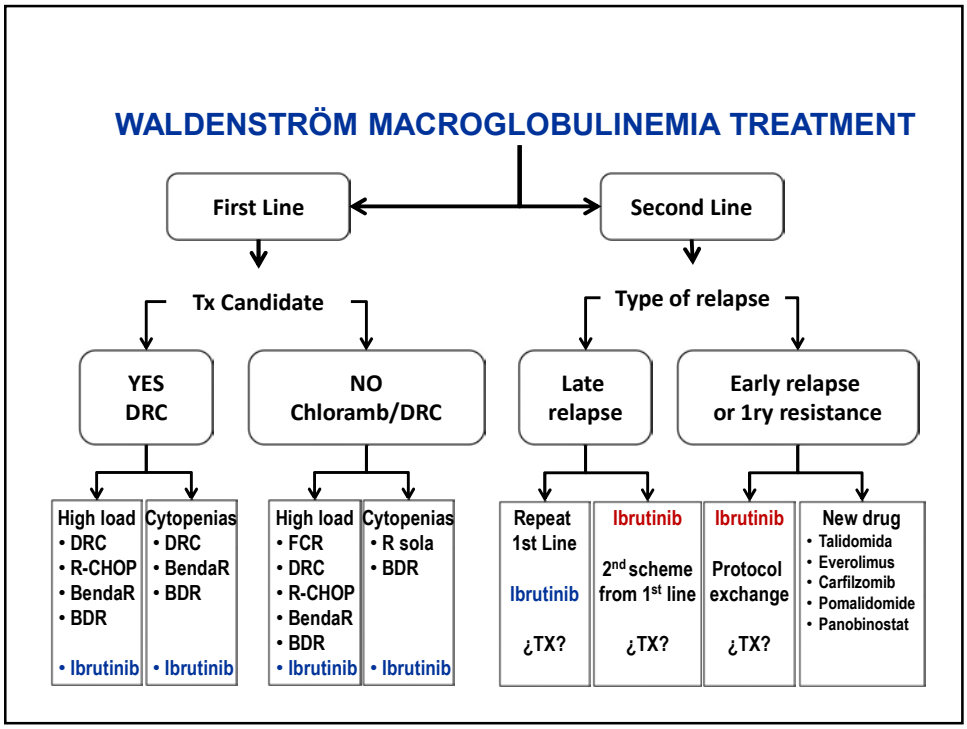


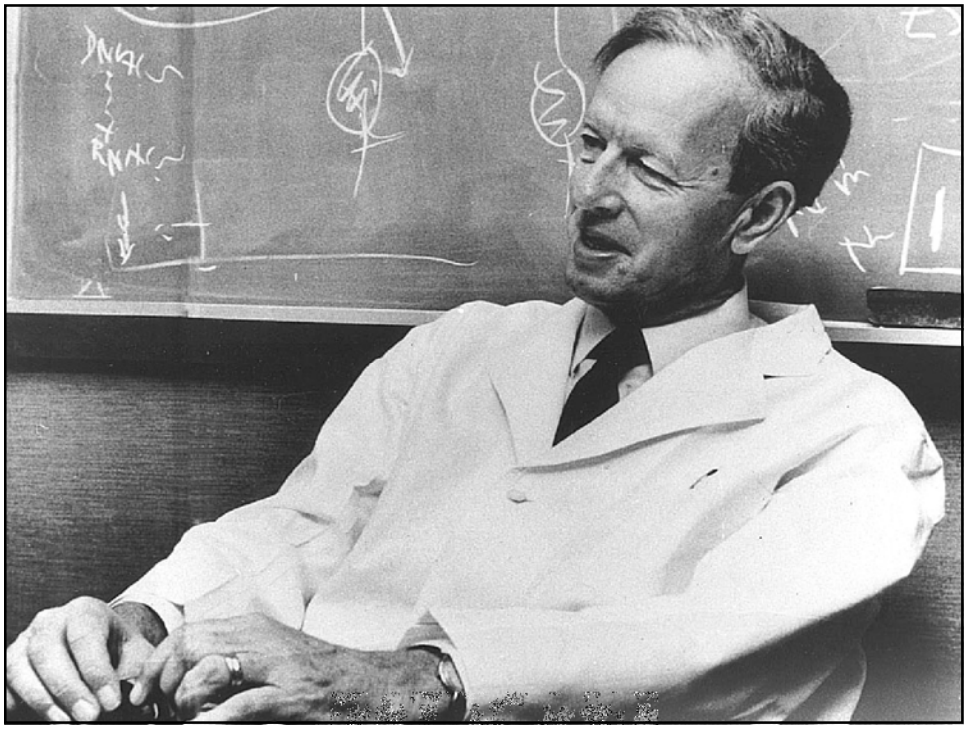
Conclusions: BGB-3111 is well tolerated and highly active in WM. Te depth and quality of response, warrant a randomized comparison against Ibrutinib

WALDENSTRÖM MACROGLOBULINEMIA TREATMENT



WALDENSTRÖM MACROGLOBULINEMIA TREATMENT





TREATMENT OF DISEASE COMPLICATIONS

Jesús G. Berdeja, M.D.
Director of Multiple Myeloma Research
Sarah Cannon Research Institute
Tennessee Oncology
Nashville, TN, USA

disclosures

- Research funding from the following:
  - Abbvie, Amgen, Bluebird, BMS, Celgene, Janssen, Novartis, Takeda, Teva

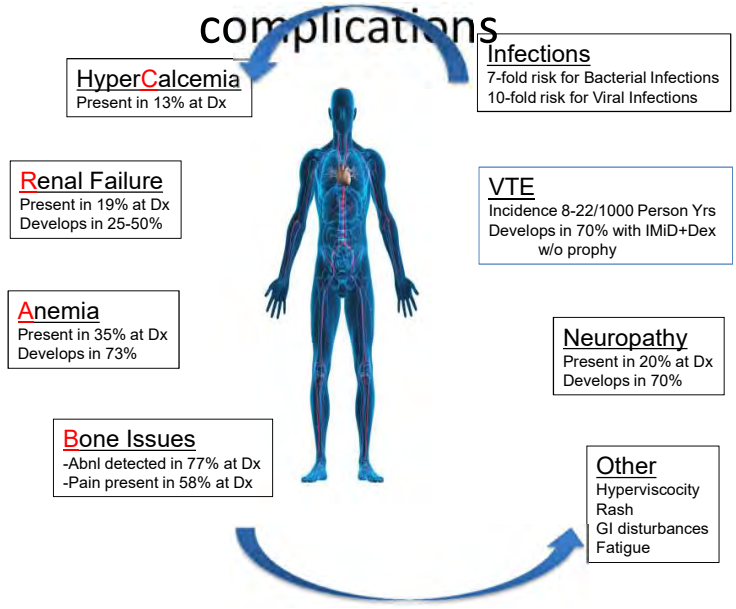
AIMS

- Identify complications due to MM and its treatments
- Review standard recommendations for prevention of complications
- Recommended management of complications related to MM itself
- Review standard recommendations for management of treatment-related complications

Case: Presentation

- A 69-yr-old man presents with low back pain, fatigue
- Physical examination: T 36.4˚, BP 186/79 mm Hg, P 75/min, R 20/min
- Laboratory assessments
  - Hb 9.6 g/dL
  - Serum creatinine 2.35 mg/dL
  - Calcium 11.9 mg/dL
  - IgG 3800 mg/dL, IgA 43 mg/dL, IgM 9 mg/dL
  - SPEP – 3gm/dL abnormal protein, IFE IgGk
  - SFKLC 200 mg/dL
  - β_2-microglobulin 6.9 mg/L
  - Albumin 3.2 g/dL
  - LDH 200 nl
- Skeletal survey: small lytic lesions spine and pelvis, compression fracture at T12
- Bone marrow biopsy: 70% k-restricted plasma cells

MM-Related and/or treatment-related complications

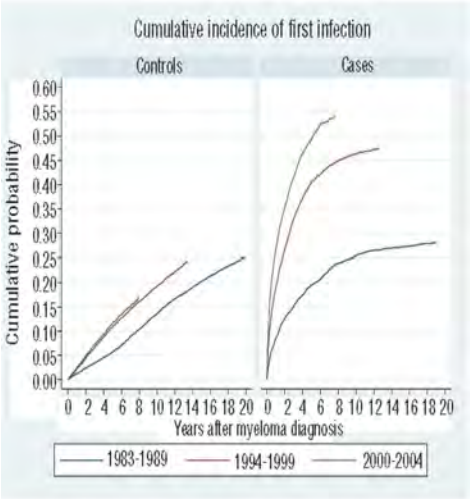


Immunosuppression in mm

- MM leads to multifactorial humoral and cellular immune dysfunction
- Anti-myeloma therapy is immunosuppressive
  - PIs can suppress T cell function
    - Grade 3 /4 infections in 35% of newly dx pts reported in VRD arm in SWOG S0777 trial
  - Lenalidomide and pomalidomide can cause neutropenia in >25% patients
    - Grade 3 /4 infections in 29% newly dx pts on len/dex reported by FIRST trial
  - Dexamethasone is pan-immmunosuppressive
- Pts often are elderly and have comorbidities that further increase risk

Tete et al. Front Immunol 2014. Dhodapkar et al. Lancet 2007. Benboubker et al. NEJM 2014. Dimopoulos et al. NEJM 2007. San Miguel et al. Lancet Oncol 2013. Rajkumar et al. Lancet Oncol 2010. Yee et al. ERJ-M 2016. Berges et al. Immunology 2008

Population-Based Swedish Study:
Cumulative incidence of first infection over time in myeloma patients and their matched controls.



Take home points:
-7-fold risk of bacterial infection
-10-fold risk of viral infection
-Infectious risk greatest during 1st yr dx
-Infections account for 20% early mortality
highest risk first 2-4 mos of treatment

-Bacterial infections predominate during the first weeks of initial therapy
-Viral infections, often due to reactivation and most common during PI/Dex treatment

Cecilie Blimark et al. Haematologica 2015;100:107-113

recommendations

- Infection prophylaxis
  - Pts should remain up to date on appropriate vaccinations
    - Yearly influenza recommended
    - Pneumovax recommended though unclear benefit but if done should be done at time of best disease control
    - Live vaccines should be avoided
  - VZV prophylaxis when receiving PIs, monoclonal abs, during ASCT recovery period is recommended with acyclovir or similar agents
  - Antibacterial prophylaxis with mixed results
    - Not routinely recommended
    - Consider in high risk patients at initial dx 2-3 mos
    - Consider with lenalidomide/pomalidomide therapy during 1st 3 mos
  - Use of IVIG is controversial
    - Consider in pts with hypogammaglobunemia and recurrent infections
  - Consider use of G-CSF in treatment induced neutropenia or neutropenic fever

Terpos et al: Haematologica 2015. Anderson et al: J Natl Compr Cancer Netw 2016. Chanan-Khan et al: JCO 2008. Lonial et al: NEJM 2015. Oken et al: Am J Med 1996. Vesole et al: Leukemia 2012. Chapel et al: Lancet 1994. Musto et al: BJH 1995. Aapro et al: EurJCan 2011.

Bone disease: scope of problem

- Osteolytic bone disease is present in up to 80% of pts at dx
- Increased osteoclast activity leads to skeletal-related events (SREs)
  - Vertebral CF
  - Other pathologic fractures
  - Spinal Cord Compression

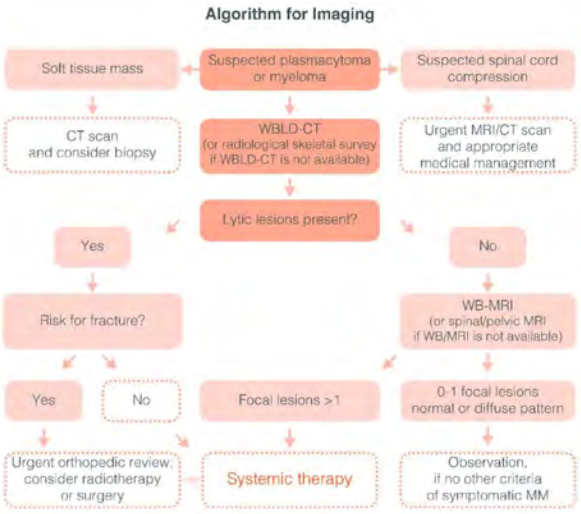
Terpos et al: Ann Oncol 2005. Kyle et al: Mayo Clin Proc 2003.

imaging

- Skeletal Survey (WBXR)
  - Current standard technique for detection of lytic lesions, widely available
- WBLD-CT
  - More sensitive and accurate than WBXR and easy to perform where available
  - Used more and more in parts of the world as a replacement for WBXR
- WB-MRI
  - now indicated as part of the definition of active MM
    - >1 focal lesion by MRI is a MM-defining
  - depicts bone marrow involvement
- PET/CT – May be substituted for MRI as above
  - May correlate better with response to therapy
  - May be useful in MRD evaluation

Dimopoulos et al: Leukemia 2009. Hillengass et al: JCO 2010. Kastritis et al: Leukemia 2014. Zamagni et al: Blood 2011. Spinnato et al: EurJRadiol 2012. Derlin et al: Eur Radiol 2013. Walker et al: JCO 2007. Waheed et al: Haematologica 2013.

EMN Guidelines: Algorithm for imaging in multiple myeloma (MM).



Evangelos Terpos et al. Haematologica 2015;100:1254-1266

Bisphosphonate use

- Pamidronate and zoledronic acid (ZA)have been found to reduce SREs in Phase III studies
- IV ZA >>> PO Clodranate
  - Reduced SREs
  - Improved OS by 10 mos in MM pts with lytic lesions
  - Effects continued beyond 2 yrs but unknow if all depths of remission benefitted equally
- No study has shown superiority of ZA over pamidronate but a meta-analysis showed a survival advantage to ZA over placebo

Berenson et al: NEJM 1996. Berenson et al: Cancer 2001. Morgan et al: Lancet 2010. Morgan et al: Blood 2012. Mhaskar et al: CDSR 2012.

Side effects of bisphosphanates

- Acute phase reactions
- Hypocalcemia
- Hypophosphatemia
- Renal impairment
- Osteonecrosis of the jaw (ONJ)

Terpos et al: JCO 2013. Berenson et al: JClinPharmacol 1997; Dimopoulos et al: Haematologica 2006.

EMN/IMWG Recommendations for bone health

- ZA 4mg over 15-30 min or pam 90mg over 2-4 h IV q3-4wks
  - All MM pts with CrCl >30 mL/min and osteolytic lesions
  - Continue ZA past 2 yrs though unclear if benefit continues for pts in ≥ VGPR, pam unclear benefit past 2 yrs
- Calcium po 600mg/d; vitamin D2 400 IU/d
  - 60% of MM pts are Vitamin D deficient, yearly levels recommended
- Adjust ZA for renal fx, hold until crcl within 10% baseline
  - hold for crcl < 30. HD ok if no expectation of recovery
- ONJ more common with ZA, after invasive dental procedures, and associated with prolonged use of ZA
  - Try to have dental clearance and extractions/traumatic procedure prior to initiating bisphosphonates
  - IMWF recommend holding for 90 days pre and post invasive dental procedure

Terpos et al: Haematologica 2015. Terpos et al JCO 2013.

Bone pain treatment

- Radiotherapy for solitary plasmacytoma, symptomatic SC compression, severe uncontrolled pain or prevention of pathologic fx
  - 3000 cGy in 10-15 fx usually sufficient
  - Can lead to delays of systemic therapy
  - Can adversely affect stem cell mobilization
- Vertebroplasty vs Kyphoplasty
- Surgery – rare
  - For pathologic fractures of long bones
  - Restore spinal stability
  - [illegible]pinal

Niesvizky et al: J Natl Compr Canc Netw 2010. Christoulas et al: Expert Rev Hematol 2009.
Drake MT. Oncology (Williston Park) 2009. Terpos et al: JCO 2013. Webb et al: Br J Pharmacol 2014.

VERTEBROPLASTY VS KYPHOPLASTY

PROCEDURE	ADVANTAGES	DISADVANTAGES
Vertebroplasty	Faster surgery and less post op pain due to smaller trocar	Cement leakage, vertebral height restoration is questionable; however, some studies show similar height restoration
Kyphoplasty	Less cement leakage, restoration of height to vertebral body preventing kyphosis at that level	Similar post op outcomes to vertebroplasty procedure while costing 20 times more and requiring overnight stay

a. Height loss
b. Upright posture becomes impossible
c. Pulmonary volume loss due to anterior wedging of the spine
d. 12 rib rests on the iliac crest
e. Narrowed gab between ribs and ilium
f. Protruding abdomen
g. Distension, constipation, early satiety, eructation

Berenson et al: Lancet Oncol 2011. Bhargava et al: JCO 2009

Renal impairment – Defined as GFR < 60mL/min

- Present in 19% of pts at dx
- Develops in 25-50% at some point in disease course
- Pathophysiology is complex
  - Principal renal mechanism is cast nephropathy
    - Direct consequence of high serum concentration of SFLC
  - Direct deposition of light chains as in LCDD or amyloidosis
- Other offending conditions
  - Hypercalcemia
  - Dehydration
  - Nephrotoxic medications

Kebler et al: Eur J Haematol 2009. Dimopoulos et al: Leukemia 2008. Hutchison et al: Nat Rev Nephrol 2011.

Management

- MM patient with RI should be considered an emergency
- Interventions should include
  - Hydration +/- urine alkalization
  - treatment of hypercalcemia
  - prompt anti-myeloma therapy
  - Use of plasma exchange, standard dialysis, high cut off dialyzers are reasonable when available but have not been proven to definitive impact course and thus not recommended as standard at this time

Burnette et al: NEJM 2011. Clark et al: Am J Nephrol 2008. Heyne et al: Am J Hematol 2012. Zannetti et al: Am J Hematol 2015.

Antimyeloma therapy in pts with renal impairment - frontline

- Bortezomib-based combinations have been shown to be most effective in reversing renal insufficiency and are the treatment of choice.
  - BTZ-based therapy may even overcome negative prognostic effect of RI (HOVON-65 trial)
- Bortezomib/Dex + Thalidomide (VTD) or cyclophosphamide (CyBorD) or doxorubicin (PAD) do not require dose-adjustments and should be 1st line
- In elderly patients also consider bortezomib, melphalan, prednisone (VMP)
- Lenalidomide can be used as long as the recommended adjustments for degree of RI are followed

Dimopoulos et al: JCO 2010. Dimopoulos et al: Leukemia 2013. Scheid et al: Haematologica 2014. Dimopoulos et al: CID 2016. Facon et al: Lancet Oncol 2016.

Antimyeloma therapy in pts with renal impairment – transplant

- High dose melphalan and ASCT can be performed safely in patient with RI, including on dialysis
- Traditionally melphalan dose has been reduced to 140mg/m2 in patients with RI
- Recent analysis by the CIBMTR reported improved outcomes and no worse toxicity in patients with mild-moderate RI (CcCl > 30mL/min) when treated with melphalan 200mg/m2

Badros et al: EJH 2004. Knudsen et al: EJH 2005. Lee et al: BMT 2004. Raab et al: Haematologica 2006. Sweiss et al: BMT 2016. Mahindra et al: ASH 2

Other Antimyeloma therapies in pts with renal impairment

- Pomalidomide
  - No need to adjust, at least with CrCl >30mL/min
- Elotuzumab
  - No need to adjust even on HD
- Carfilzomib
  - No need to adjust
- Daratumumab
  - No data but likely safe?
- Bendamustine
  - no need to adjust
- Ixazomib
  - needs adjustment only for pts with CrCl <30 mL/min or on HD

Weisel et al. Haematologica2016; Berdeja et al. CLML 2016; Quach et al. CCP 2017; Ponish et al. JCRCO 2013; Gupta et al. BJH 2016.

Case 2: Presentation

- 57-yr-old man diagnosed with MM
- Was started on
  - Bortezomib
    - 1.3 mg/m^2 IV on Days 1, 4, 8, 11
  - Thalidomide
    - 100 mg PO on Days 1-21
  - Dexamethasone
    - 40 mg PO on day of and day following btz
- After cycle 2, M-spike had decreased to 0.3 g/dL, but noted numbness, burning, stabbing sensation feet and legs

PERIPHERAL NEUROPATHY: RISK FACTORS AND GENERAL CONSIDERATIONS

COMMON PROBLEM AT BASELINE DUE TO CO-MORBIDITIES AND MM AND EVENTUALLY FROM

General Considerations

- Endocrine disorders
  - Hypothyroidism
  - Diabetes
- Nutritional disease
- Connective tissue disease
- Vascular disease
- Medications
- Herpes zoster
- Most common symptoms
  - Sensory deficits
  - Neuropathic pain

Disease- and Treatment-Related Factors

- Hyperviscosity syndrome
- Hypergammaglobulinemia
- Incidence of peripheral neuropathy at diagnosis: 20%
- Up to 75% of pts on therapy
- Incidence of grade 3/4 CIPN with novel agents
  - Bortezomib: 6% to 22%
    - ↓ with wkly vs twice-weekly dosing
    - ↓ with SC administration
  - Thalidomide: 3% to 23%
    - ↑ with higher doses and prolonged therapy, often permanent
  - Carfilzomib: < 2%

Gleason C, et al. J Natl Compr Cancer Netw. 2009;7:971-979. Palumbo A, et al. J Clin Oncol. 2014;32:587-600. Kurtin S, et al. J Adv Pract Oncol. 2013;4:307-321. Siegel D, et al. Haematologica. 2013;98:1753-1761. Richardson et al: Leukemia 2012. Delforge et al: Lancet Oncol 2010.

Thalidomide VS Bortezomib

PN and associated symptoms

- Thalidomide
  - Affects larger myelinated axons
    - Cumulative
    - Dose-dependent
    - Mostly irreversible
  - Autonomic dysfunction
    - Dizziness
    - Orthostasis
  - Tremor
    - Reversible with dose adjustment/discontinuation
- Bortezomib
  - Affects small myelinated and unmyelinated fibers
    - Hyperesthesia
    - Neuralgia
    - Altered temperature sensation
    - Reversible if intervene early
  - Autonomic dysfunction

Richardson et al: Leukemia 2012. Delforge et al: Lancet Oncol 2010. Delforge et al: Blood 2017

PN management

- Careful attention with pts on therapy
  - Prompt dose reductions for thalidomide
  - Bortezomib – SQ dosing, weekly dosing , dose reduction
    - Randomized trial IV vs SQ dosing
      - all grade PN decreased from 53% to 38%
      - grade 3 and 4 PN decreased from 16% to 6%.
- Treat neuropathic pain (ref)
  - Analgesics
  - Calcium channel blockers (e.g. gabapentin, pregabalin)
  - Serotonin-norepinephrine reuptake inhibitors
  - Tricyclic antidepressants (e.g. amitriptyline)
  - Acetyl-L-carnatin and alpha lipoic acid have shown activity in chemo-induced PN but no prospective analyses

Richardson et al: Leukemia 2012. Tempescul et al: Hematologica 2015. Delforge et al: Blood 2017. Jordan et al: J Neurooncol 2015

Venous Thromboembolism (Vte)

- MM patients at higher risk due to several factors specific to disease and treatments
- Incidence VTE is 8-22/1000 person years
- Highest risk during first 4 months of treatment
- Incidence increases by up to 70% with IMiDs+Dex in absence of anticoagulation
- A randomized study with lenalidomide-based therapy established benefit of thromboprophylaxis with both ASA and enoxaparin
  - The incidence of VTE was
    - 2.3% in patients on aspirin 100mg/day
    - 1.2% in pts on enoxaparin 40mg/day

De Stefanis et al: Semin Thromb Hemost 2011. Dimopoulos et al: Leukemia 2011.
Dimopoulos et al: Leukemia 2014. Palumbo et al: Leukemia 2008. Larocca et al: Blood 2012.

Imwg risk factor assessment and prophylaxis recommendations

RISK FACTORS

Palumbo A, et al. Leukemia. 2008;22:414-423.

Treatment-related	Patient-specific	Myeloma-specific
IMiDs	Age	Active/uncontrolled Disease
High-dose Dexamethasone	Previous VTE	Hyperviscocity
Erythropoietin	Infection	
Anthracyclines	Surgical Procedure	
Multiagent chemotherapy	Cardiovascular Co-morbs	
	Immobilization	
	Inherited thrombophilia	
	Central venous catheter	
	Recommendations for thromboprophylaxis	
Risk factor	**Number of risk factors**	**Therapy**
Treatment-specific	≥ 1	LMWH or warfarin
Patient-specific	1	ASA
Myeloma-Specific	1	ASA
Patient or myeloma-specific	≥ 2	LMWH or warfarin

Risk Assessment for VTEs in Pts Receiving IMiD-based Therapy

- VTE prophylaxis for individual risk factors (eg, age or obesity) or myeloma-related risk factors (eg, immobilization or hyperviscosity)
  - If ≤ 1 risk factor present, aspirin 81-325 mg/day
  - If ≥ 2 risk factors present, LMWH (equivalent to enoxaparin 40 mg/day) or full-dose warfarin (target INR: 2-3)
- VTE prophylaxis for myeloma therapy–related risk factors (eg, high-dose dexamethasone, IMiDs, doxorubicin, multiagent chemotherapy)
  - LMWH (equivalent to enoxaparin 40 mg/day) or full-dose warfarin (target INR: 2-3)

Palumbo A, et al J Clin Oncol. 2014;32:587-600.
Palumbo A, et al. Leukemia. 2008;22:414-423.

anemia

- Present in almost 75% of all newly dx pts and universally in relapsed disease
- Causes multifactorial both disease specific and treatment-induced
- Renal insufficiency common

Kyle et al: Mayo Clin Proc 2003. Willan et al: Clin Interv Aging 2016. Silvestris et al: Blood 2002. Birgegard et al: EurJH 2006.

Management of anemia

- PRBC transfusion for rapid restoration
- Erythropoiesis-stimulating agents (ESAs)(Erythropoietin and darbepoetin)
  - No clear guidelines for use in MM
  - Conflicting study results in patients with MM
    - Vista, subanalysis, revealed no inferior outcome with ESA use in MM but small subset
  - ASH and ASCO recommends ESA use at lowest possible dose to avoid transfusions

Mhaskar et al: JNCCN 2010. Baz et al: Acta Haematol 2007. Katodritou et al: Ann Hematol 2008. Richardson et at: BJH 2011

ESA-use considerations

- Important potential side-effects
  - Increase thromboembolic complications
  - HTN
  - Possible increased mortality
- Consider use in patients with
  - Persistent hgb <10 or who are transfusion dependent
  - Ruled out other reversible causes such as iron/B12 def
  - Target hgb should be no more than 12 g/dL
- ESA use remains controversial

Lyman et al: Cancer 2006. Niesvizky et al: JNCCN 2010. Baz et al: Acta Haematol 2007.
Katodritou et al: AmJHematol 2008. Richardson et at: BJH 2011

CArdiotoxicity

- Mechanism unclear
  - Direct endothelial effects, Sarcomeric protein turnover inhibition are hypotheses
- Thought to be a class effect for PIs
  - Cardiac failure Gr 3 or higher
    - Vd 3%, IxaRd 3%, KRd 7%, Kd 6%
  - HTN Gr 3 or higher
    - Vd 3%, IxaRd 3%, KRd 4%, Kd 9%
- Carfilzomib most concerning
  - All grade dyspnea 25%, HTN 15%,
  - In absence of other cardiac risk factors, severe cardiac failure ~5%
- Additional risk factors
  - Other cardiotoxic agents, mediastinal XRT, cardiac amyloid, high dose steroids

Subedi et al: Ann Hematol 2014. Kumar et al: Blood 2016. Rosenthal et al: Blood Cancer J 2016. Hasinoff et al: Cardiovasc Toxicol 2016.
Moreau et al: Lancet Oncol 2011. Stewart et al: NEJM 2015. Dimopoulos et al: Lancet Oncol 2016. Moreau et al: NEJM 2016. Danhof et al: EJH 2016.

Carfilzomib Cardiac-directed management

- Prior to starting therapy
  - Scree for cardiovascular risk factors
  - HTN and other cardiovascular issues should be optimally controlled prior to starting
- During treatment
  - Regular clinical surveillance
  - Good BP control
  - Serial echo, BNP are of uncertain benefit
- If cardiac failure develops
  - Discontinue use
  - Detailed cardiac evaluation and treatment
  - Once cardiac function restored
    - If individual risk-benefit favorable consider restarting carfilzomib
    - Consider dose reduction

Rosenthal et al: Blood Cancer J 2016. Russell et al: Blood 2015. Mikhael: CLML 2016.

Suggested Empiric Age-Adjusted Dose Reduction in Pts With Myeloma

Agent	Younger Than 65 Yrs	65-75 Yrs	Older Than 75 Yrs
Dexamethasone	40 mg/day on Days 1-4, 15-18 q4w ***or*** Days 1, 8, 15, 22 q4w	40 mg/day on Days 1, 8,1 5, 22 q4w	20 mg/day on Days 1, 8, 15, 22 q4w
Melphalan	0.25 mg/kg on Days 1-4 q6w	0.25 mg/kg on Days 1-4 q6w ***or*** 0.18 mg/kg on Days 1-4 q4w	0.18 mg/kg on Days 1-4 q6w ***or*** 0.13 mg/kg on Days 1-4 q4w
Cyclophosphamide	300 mg/day on Days 1, 8, 15, 22 q4w	300 mg/day on Days 1, 8, 15 q4w ***or*** 50 mg/day on Days 1-21 q4w	50 mg/day on Days 1-21 q4w ***or*** 50 mg/day QOD on Days 1-21 q4w
Thalidomide	200 mg/day	100 mg/day ***or*** 200 mg/day	50 mg/day to 100 mg/day
Lenalidomide	25 mg/day on Days 1-21 q4w	15-25 mg/day on Days 1-21 q4w	10-25 mg/day on Days 1-21 q4w
Bortezomib	1.3 mg/m^2 bolus on Days 1, 4, 8, 11 q3w	1.3 mg/m^2 bolus on Days 1, 4, 8, 11 q3w ***or*** on Days 1, 8, 15, 22 q5w	1.0- 1.3 mg/m^2 bolus on Days 1, 8, 15, 22 q5w

Palumbo A, et al. N Engl J Med. 2011;364:1046-1060.

Treatment-related complications and recommendations (Adapted from emn recs)

Complication	Treatment	AE grade	Dosing Recommendations	Management
Neutropenia	Len-based	Gr 2/3 w infection or Gr 4	None if expected to improve or 25-50% dose reduction	GCSF until neutrophil recovery
Anemia	All	Gr 2-4 (hgb <10 g/dL)	None if expected to improve or 25-50% dose reduction	Consider ESA use
Renal	Len	CrCl 30-60 mL/min CrCl < 30 mL/min, no HD CrCl < 30 mL/min, yes HD	10 mg QD 15 mg QOD 5 mg QD	Correct other associated factors: dehydration, hypercalcemia, hyperuricemia, other nephrotoxic meds
Neuropathy	Thal-based	Gr 2 Gr 3-4	50% dose reduction Discontinue until Gr 1 then restart at 50% dose	Monitor carefully Consider symptomatic treatment
	Bor-based	Gr 1 with pain or Gr 2 Gr 2 with pain or Gr 3 Gr 4	Switch to SQ from IV; Switch to weekly dosing Dose reduce from 1.3 to 1.0 to 0.7 mg/m2 Hold and resume when Gr 1 or less Recs as in lower grade but dose reduction rec Discontinue use	Monitor carefully Consider symptomatic treatment
VTE	Thal/Len	All grades	Temporary discontinuation and full anticoagulation	Reevaluate for retreatment
